*Issues in education.* Plagiarism in the electronic age has become very easy – a function of cut and paste actions embedded in software programs to make writing easier. Cutting and pasting within a single document or cutting and pasting from other documents into a new document eliminates the tedium of retyping text. The functional ability to cut and paste easily, along with electronic plagiarism detection software has likely raised awareness of the problem of plagiarism in the classroom. Accidental plagiarism can easily occur when quotation marks are not appropriately included, or a longer quotation is formatted incorrectly; meticulous formatting and punctuation serve to differentiate the ideas of others from the ideas of the author.

The ability to easily access multiple publications electronically has facilitated mosaic or patchwork plagiarism, which refers to a practice

of using phrases or parts of paragraphs without attribution from one or more sources. Mosaic plagiarism is sometimes characterized by uneven or choppy writing. Intermingling sentences or phrases from multiple authors, all of whom have a distinctive writing style, can sound awkward. This awkwardness is compounded by the need to link the disparate voices together into an entire paragraph or argument in a thesis. Mosaic plagiarism is usually intentional but may result from a lack of understanding of the underlying material or a lack of facility with the language.

Universities have policies on plagiarism in student work; they also provide writing support to students to teach proper citation practices for course work, theses, and dissertations. Prior to entering university, students should have learned to use quotation marks when copying something verbatim from another source, but they may not have learned how to properly paraphrase or synthesize multiple reference sources. Courses and websites at universities devoted to academic writing include useful information on these issues. Poorly done paraphrasing simply replaces some words with synonyms while maintaining the same construction of the sentence or paragraph. Mosaic plagiarism can result from combining several sentences, poorly paraphrased, from multiple sources. A well-paraphrased idea, because it comes from another source, still requires citation to the original source but not quotation marks.

*Copyright issues.* Copyright is a legal right conferred upon the originator of a work. Usually, the copyright is held by the originator of the work, although that right can be transferred to a publisher, an institution, or another person. Copyright laws vary by country but all originate from the legal system of that country. Plagiarism can violate copyright in some instances, but it is not the same. In the publishing world, copyright to an article might be held by the author and signed over to the scholarly society that publishes the journal in which it is printed. In such a case, plagiarism of that article would infringe upon the society's rights (copyright holder) and result in loss of revenue, which could be adjudicated in a court of law. Copyright is often held by the author with an exclusive right to publish the

work granted to a publisher. Abuse of that copyright would infringe on the rights of both the author and the publisher even if there are no associated monetary benefits to the author. Although a Creative Commons license on a publication is less restrictive on sharing or distribution than traditional copyright allows (<https://creativecommons.org/licenses/>), the original creator retains credit for the work. Depending on the rights granted by the originator, an article may be reprinted as long as the original author is credited.

In academia, “fair use” policies for copyrighted words apply, and a student may include an extended quotation from another work that does not violate copyright. Fair use is not, however, a straightforward policy or law, but academic institutions retain legal counsel to interpret specific situations. If the student has properly attributed the quote to the originator and clearly differentiated the quoted ideas from his own ideas, this would not be considered plagiarism or a copyright violation. A Creative Commons license on a publication does not negate that requirement. Another common copyright issue in academics is the production of student performances using a copyrighted play. Permission is required to produce the play to avoid copyright violations but producing the play or speaking the lines in the dialogue are not considered plagiarism even if permission has not been obtained as required by copyright law.

## Plato on Virtuous Leadership and Business Ethics

David C. Bauman

Anderson College of Business and Computing,  
Regis University, Denver, CO, USA

## Synonyms

Justice in business; Leadership character; Moral managers

## Introduction

According to Plato’s dialogues, leaders become virtuous by diligently studying what virtue is, what justice, temperance, and courage require, and how to tell what is good from what is bad. A virtuous business leader with this knowledge then uses the virtue of wisdom to do the right thing, at the right time, and in the right way. The leader also subordinates desires for wealth and honor to what wisdom requires. After more than 2000 years, Plato’s insights into virtuous leadership and ethics in business are relevant today.

## Plato, Socrates, and Aristotle

Plato (428–348 BCE) is a central figure in ancient philosophical thought and ethics. He was a student of Socrates (470–399 BCE), wrote multiple dialogues recounting Socrates’ questioning of well-known Athenians, advised leaders and kings, founded the Academy in Athens, and taught and worked with Aristotle (384–322 BCE).

Two important distinctions need to be made about Plato’s writings before considering his virtuous leadership account. First, the account provided is designated as Plato’s and not Socrates’ account because Socrates never wrote a book and Plato’s voice is the one that presents the arguments. Second, it is assumed that Plato developed his views on virtue over time from his early, middle, and late dialogues. Unlike Aristotle who

gives a specific virtue account in the *Nicomachean Ethics*, constructing Plato's account of virtuous leadership requires gathering a variety of arguments from different dialogues. Note also that when people write about "virtue ethics" in the professions, they often mean Aristotle's account or a neo-Aristotelian account that excludes his outdated views on slavery and women. Plato's virtue ethics account is unique.

## Ethics, Virtue, and Knowledge

Many leadership and business ethics discussions revolve around ethical principles, codes, or standards that leaders should follow to make ethical decisions. For Plato, finding the perfect set of ethical principles was not his goal. He directed his attention to the more fundamental state of a person's character (*ethos*) which is the seat from which virtue arises. Plato tries to explain how to develop virtuous people and leaders. He does not ask "What is the just thing to do?" but instead asks "How does one become a just person?"

The word translated "virtue" is the Greek word *arête* which means "excellence" or a characteristic of something or someone which disposes it/them to do something well. For example, a good eye has the virtue (excellence) of seeing well and a good auditor has the virtue (excellence) of identifying accounting mistakes. Lacking these virtues indicates that they are not a good or well-functioning eye or auditor.

In the realm of moral excellences or virtues, Plato wrote dialogues in which his main character Socrates challenges people to give an account of specific virtues like justice or courage. In the *Meno*, Socrates takes on the broader task of finding an account of virtue itself. He invites the handsome, wealthy, and impatient young leader Meno to join him in constructing the account. Meno wants a quick answer, but Socrates knows that Meno will only learn if he struggles to find an answer. Meno argues that virtue itself is benefiting your friends, harming your enemies, ruling over people, and having power to get what you want like gold, silver, and honor. Socrates leads Meno to refute his own definitions one by one. Finally,

Meno agrees with Socrates that acquiring power and goods is not virtue, but *how* they are acquired is the virtuous part. Socrates says, "Then to provide these goods would not be virtue any more than not to provide them, but apparently whatever is done with justice will be virtue, and what is done without anything of the kind is wickedness" (*Meno* 79a) (Plato 1997).

Plato presents two central aspects of virtue and becoming virtuous in the *Meno* and similar dialogues. The first is that to become virtuous, one must *know* what virtue is and what it is not (*Meno* 100b) (Plato 1997). Plato says that Socrates did not know anything, and that is why Socrates invited self-professed "virtue experts" to let him question them. In these dialogues, Socrates usually leaves his partners frustrated because they cannot give an account of the virtues that they professed to know. Plato recounts what Socrates said before a jury in Athens: "I found that those who had the highest reputation were nearly the most deficient, while those who were thought to be most inferior were more knowledgeable" (*Apology* 21e) (Plato 1997).

Plato does contend that we can come close to knowing an account of virtue and that this knowledge guides us to act virtuously. Consider courage. When a senior manager *knows* that he/she should not fear those who want to cut the safety budget which will harm employees and the company, then he/she can courageously defend his/her budget. Similarly, if a CEO *knows* that telling the truth to investors is the just thing to do and lying to them is unjust, then he/she should tell the truth. The issue of what motivates virtuous action is addressed later.

In addition to pursuing the knowledge of virtue and specific virtues, a virtuous leader must also learn what is *good* and *evil*, and what is *noble* and *shameful*. The Greek phrase *to kalon* is translated as "noble" which expresses a fine, beautiful, and admirable goodness. Examples would be a well-trained athlete competing fairly or a leader giving team members the credit they are due. A leader searching for an account of a virtue will also be searching for what is good and noble. Plato states that pursuing an account of courage also results in pursuing an account of a "fine and good" person

(*Laches* 187d6-188c3; Plato 1997). Here is where ethical principles and theories can guide the leader in determining what is good and noble.

The second aspect of becoming a virtuous leader is *diligently and humbly* pursuing the knowledge of the virtues. In the *Meno*, Plato concludes that virtue can be *learned* even though it probably cannot be *taught*. The virtuous leader continually pursues the knowledge of virtue and does not wait to be taught. Plato compares the pursuit of virtue to the pursuit of wealth by a citizen named Anthemion. Socrates tells the impatient Meno that Anthemion “did not become rich automatically or as the result of a gift . . . but through his own wisdom and efforts. Further, he did not seem to be an arrogant or puffed up or offensive citizen in other ways, but he was a well-mannered and well-behaved man” (*Meno* 90a) (Plato 1997). Similarly, learning virtue requires diligent and humble effort.

A virtuous leader’s *ethos* is founded on the pursuit and acquisition of the knowledge of virtue, the virtues, and what is good and noble. Plato uses several models of virtuous leadership (e.g., doctors, ship captains, and teachers) to reinforce the importance of knowledge and expertise for leaders (Scott and Freeman 2021). Plato, however, warns about leaders who lack this knowledge and lead people astray.

### Warning: Leaders Who Are Ignorant of Virtue

Ancient Athens had its share of manipulative orators (public speakers) and sophists (private teachers) who persuaded people to believe things that may or may not be based on knowledge. In the *Gorgias*, Plato warns that a skilled and ignorant orator can use *rhetoric* (persuasive speech), to convince people about what is “just and unjust, what’s shameful and admirable, what’s good and bad. . .” (459d) (Plato 1997). The result is people following leaders to their own harm. These influencers may spread their own false views or merely reinforce the popular but mistaken views of the crowd.

In business clear examples can be seen of leaders who lack the knowledge of what is good and just and then lead many to invest in failed ventures. The investors in the company Theranos believed its leaders who said that they had developed a new blood-testing technology. The technology did not work and investors lost hundreds of millions of dollars (Carreyou 2018). Similarly, Jho Low was the leader of the 1MDB Malaysian wealth fund who persuaded Goldman Sachs’s bankers to organize a bond sale even though the financials supporting the bonds were inaccurate (Wright and Hope 2019). Goldman Sachs’s was fined over \$5 billion for its involvement in the 1MDB scam (Michaels et al. 2020).

In cases of corporate deception, Plato could argue that these leaders do not truly *know* what is noble and just. Instead, they follow their own subjective *opinions* and then use persuasive speech to convince others to follow. But what leaders are doing seems to be more dynamic than a lack of knowledge. Plato sees this gap and expands on his virtue = knowledge view with an account of motivation.

### The Moral Psychology of Virtuous Leaders

In the *Republic*, Plato describes three classes of people in a city (money-makers/producers, guardians/soldiers, and rulers/philosopher kings), three “parts” of the human soul (appetitive, spirited, and rational) that match them, and the three virtues that align with each. Plato uses this framework to explain the moral motivations that virtuous leaders must develop.

The money-lovers or producers make up the majority of society. They are merchants, bankers, farmers, doctors, architects, ship captains, and others who work regular jobs. Plato broadly generalizes that these people are attracted to gaining wealth to buy things that bring pleasure. The producers align with the *appetitive* part of the soul which seeks pleasure from food, drink, sex, and other things. The knowledge of which appetites to fulfill and which ones to ignore is the virtue of *temperance* or self-control. The knowledge found

in temperance is limited in scope, like deliberating about eating a cheeseburger or a salad given one's health goals. Plato argues that in a city and in one's soul, the virtue of temperance appears when the attraction to pleasure (e.g., cheeseburger) is subordinated to the best ruler and virtue, wisdom (*Republic* 432a) (Plato 1992).

The guardians or soldier class are those young men and women who are naturally attracted to honor. Following Plato's contention that virtue requires knowledge, these young people are trained on the knowledge of what is actually pleasurable and painful, fearful and harmless. For example, feeling pain in battle should be perceived as pleasure because it is for the purpose of defending the city (*Republic* 429d) (Plato 1992). Plato aligns this class with the *spirited* part of the soul which is naturally attracted to honor and victory. *Courage* is the virtue that the spirited part demonstrates when it is trained on the knowledge of what to fear and what not to fear (*Republic* 429b) (Plato 1992).

The final class is the rulers or philosopher kings, of whom there are few. The philosopher-kings love learning and are attracted to seeking knowledge of what is virtuous and good (*Republic* 428e) (Plato 1992). An attraction to learning, however, does not qualify someone to be a ruler. Plato outlines an extensive leadership training program. Candidates must first complete years of physical training, a decade of math and science studies, and then five years of practice in argumentation. Only the top students enter a 15-year apprenticeship where they will hold different jobs in the city. Plato states, "But in these [positions], too, they must be tested to see whether they'll remain steadfast when they're pulled this way and that or shift their ground" (540a) (Plato 1992). By having knowledge and training in virtue and what is good, these virtuous leaders will not be deceived or easily tempted away by false accounts of virtue. At the age of 50, these male and female leaders will be strongly encouraged to rule the city and prepare the next generation of philosopher-kings (Bauman 2018). A main task of the philosopher-kings (and queens) is building healthy relationships between the producer and guardian classes.

The *rational* part of the soul matches the rulers and is characterized by the wise oversight of the whole soul (*Republic* 428c) (Plato 1992). Just as the rulers harmonize the other classes, the rational part of the soul guides and harmonizes the appetitive part with the spirited part. The virtue aligned with the rational part is *phronesis* which is wisdom and prudence. Wisdom can be defined as the knowledge to assess a situation and doing the right action, at the right time, and in the right way.

Plato's virtuous leadership framework combines knowledge and motivation, and outlines three additional requirements for virtuous leaders and the corporate cultures that they create.

1. *Recognize and manage the attraction to wealth and pleasure.* The attraction to wealth and pleasure can overcome leaders who lack temperance because they do not submit to wisdom. The news contains many stories of leaders who ruin their companies and careers because they pursue wealth and pleasure and not wisdom. Accounting fraud, hiding safety issues, sexually harassing coworkers, and intentional discrimination are symptoms of a leader who lacks temperance. Plato warns that leaders and organizations dominated by a strong attraction to wealth will devalue virtuous people. He states, "So, when wealth and the wealthy are valued or honored in a city, virtue and good people are valued less" (*Republic* 550e) (Plato 1992).
2. *Recognize and manage the attraction to honor and fame.* Plato also warns that leaders who are attracted to "winning" at all costs and seeking fame destabilize themselves and their organizations. While wisdom ensures that each virtue is doing its job, an overemphasis on courage can motivate the leader to forget what should be feared. These leaders and their companies may launch expensive and risky ventures and then rationalize their actions when they fail. The culture may justify lying to regulators in order to dominate a market, like Volkswagen AG's engineers did with their emission-defeating software (Tabuchi and Ewing 2016) or deceiving large clients about a product like Theranos did to Walgreens (Carreyou 2018).

3. *Gain wisdom by asking questions and training.* The way to defeat the uncontrolled attraction to wealth, pleasure, and fame is to commit oneself to gaining wisdom. Virtuous leaders know enough about virtue and what is good so that they do the right thing, at the right time, in the right way. Leaders with wisdom are always learning and tend to consistently do two things. First, they ask a lot of questions because they *know what they do not know*. They question people intensely until they understand enough to make a decision, or delegate the decision to more experienced people (Collins 2001). Second, like the philosopher-kings, virtuous leaders spend time learning about operations, customers, investors, government regulators, and employees with the purpose of coordinating and harmonizing their resources to fulfill the organization's purpose.

Virtuous leaders pursue the knowledge and motivations to be temperate, courageous, and wise, but where is the central virtue of justice?

### The Just Leader

A common ancient definition of justice is “to give to each what is owed” and injustice is “outdoing” others (Gk. *pleonexian*) or taking more than what is owed (*Republic* 331e, 344a) (Plato 1992). The character Thrasymachus in the *Republic* disagrees. He states that, “A just man always gets less than an unjust man” because he cheats and takes as much as he can in business (*Republic* 343d) (Plato 1992). An example of injustice today could be the leaders of social media, search, and app companies which are gathering more and more user data without asking what users are owed.

Plato recognizes the temptation to act unjustly by acquiring more than what is owed, and he argues that a person who lacks temperance is on a path to poverty and ruin. No one trusts Thrasymachus' unjust person. The best employees and managers will not work for this leader, and banks will not agree to contracts unless they are paid more than usual (*Republic* 579e)

(Plato 1992). The unjust leader must pay more for everything in the long run.

Plato explains that justice *emerges* in the city and organization that is led by the wise and virtuous leader. Justice is “doing one's work and not meddling with what isn't one's own” (*Republic* 433b) (Plato 1992). Bauman (2018) states that Plato “explains that when wisdom (i.e. rulers who harmonize relationships), courage (i.e., preserving beliefs about what is truly pleasurable and fearful) and temperance (i.e., the harmony of all groups agreeing on what is best) exist in the city, that justice ‘is the power that makes it possible for them to grow in the city and that preserves them (433c). Justice emerges when citizens do their own work and it contributes more to the virtuous city than the other three virtues’ (14).

To become a just business leader only requires becoming a virtuous leader.

### Conclusion

Becoming a virtuous leader, making ethical business decisions, and creating a virtuous organization are lifelong pursuits. Any professional who wants to pursue these goals starts by learning what is actually virtuous and noble. While learning this specialized knowledge, the professional practices harmonizing the virtues of temperance, courage, and wisdom. The result, according to Plato, will be leaders who have well-ordered souls that create well-ordered and harmonious organizations which are characterized by justice. The noble organization gives employees, customers, investors, and communities what they are owed and those who shamefully take more than what is due are removed.

Antarctic tourism; Arctic tourism

## Introduction

Tourism activity in the polar regions has garnered considerable research and government interest (Stewart et al. 2017). Though tourism numbers are small compared to mainstream destinations, the stakes in polar tourism are high given the pressures exerted by industry growth in combination with environmental sensitivities and global

influences including climate change and resource development. The Arctic and the Antarctic share some similarities, but the differences are significant in respect of tourism development and potential. Nonetheless, the ethics of polar tourism for both regions fall under the broad concerns of sustainable tourism and ecotourism, reflecting ethical questions around behavior of the industry and tourists, impacts on the environment and people, and the extent of local involvement, with a view to developing tourism that is sustainable and appropriate.

## Toward Sustainable Tourism Through Ethics

The tourism industry worldwide has spent several decades considering major ethical issues around sustainability in regions where the activity has the potential to cause harm to the environment and to people (see Fennell and Malloy 2007; Grimwood and Fennell 2011). Both the Arctic and the Antarctic are regions where there is great potential for tourism to harm flora and fauna, physical and cultural landscapes, and affect individuals and their communities. Tourism operators must ask whether they should participate in polar tourism and, if the answer is yes, ask how they can minimize their negative impacts and optimize their positive impacts. Part of that answer will reflect the kind of tourism operators wish to pursue. Operators who follow an ecotourism approach will seek to have minimal impacts on the environment and on local communities while ensuring manageable impacts, including the pursuit of positive local outcomes.

In the Arctic, ethical questions include those related to ensuring local and Indigenous involvement that supports their participation as employees and owners of tourism businesses. A key starting place for operators from outside the Arctic is to establish effective consultation with communities and their governments to ensure that tourism activity is desired. In the Canadian Arctic, for example, several communities (e.g., Arctic Bay and Clyde River) have

requested a moratorium on tourism development at various points in order to develop local tourism development plans and guidelines that ensure local benefit and minimization of negative impacts. Ethical operators make a point of asking about desired tourism development rather than assuming that all tourism will be welcomed.

Related to this is the extent of local involvement and control. Arctic regions often provide destinations and opportunities for tourism activity without sufficient control over the products and economic benefit. True partnerships require that local operators have decision-making capacity and participate in and benefit from the profits. The economic leakage that has been the standard with head offices located far away does not provide local businesses with sufficient opportunities. Given that destination areas pay the costs of tourism, it is only fair that more benefits remain local.

Svalbard and the entire Antarctic have no Indigenous populations, but in both areas, science and conservation have become significant. Svalbard, managed by Norway, has clear expectations about behavior by the tourism industry and tourists. A strong local tourism industry has evolved, ensuring that there is a good degree of local control and economic benefit. Much of the European Arctic is fully integrated into national economies, but even in these areas, tourism businesses must ensure local involvement in both the control of the activity and in the benefits of the tourism economy.

In the Antarctic, concerns about industry development were at the heart of the creation of the International Association of Antarctica Tourism Operators (IAATO), an industry membership group that has been at the forefront of managing tourism. In this polar region, ethical questions revolve around ensuring tourist behavior and industry practices cause as little damage as possible to the fragile and largely pristine environment while ensuring the ongoing existence of a tourism industry. The nature of the tourism product requires considerable management of both tourists and operators so that all visitors have the opportunity to see a “pristine” polar wilderness.

In both polar regions, concerns about managing impacts in order to limit damage to the environment and local culture, or in the case of the Antarctic, valued historical artifacts, resulted in the creation of codes of conduct for the industry and visitors. Created by various groups and reflecting distinctions between the two polar regions and within the Arctic region itself, these codes are an attempt to respond to the largest ethical question of sustainable tourism: how can we have a tourism industry without destroying the integrity of the environment and culture upon which it is based? Codes are used to educate operators and tourists about their impacts, best practices, expected behavior, and in some cases legal obligations. As a form of self-regulation, codes largely require their audiences to buy-in to the position that following them is the right or ethical thing to do.

Education of visitors in many parts of the polar regions includes the concept of “ambassadorship” (Maher 2011), the idea that those who are privileged to visit these special areas often feel compelled to help protect them. Visitors are encouraged by operators to support conservation efforts and community projects, for example, through financial donations, continued education, and sharing new knowledge with others when they return home. For tourists who are themselves concerned about tourism ethics, the act of ambassadorship might be seen as a way to balance their negative impacts. Because visiting the polar regions is often viewed as a “once in a lifetime” experience, ambassadorship has, in some cases, been highly effective in helping to raise funds and awareness for conservation efforts (Frew 2012). A note of caution is raised in research by Powell et al. (2008), who found that there is no direct match between the intentions fostered through the idea of ambassadorship and actual behavioral change following the trip.

The contribution of air travel to greenhouse gases is well known, as is the disproportionate impacts of climate change on the polar regions, particularly the Arctic. A developing ethical issue for industry and tourists alike is reconciling the benefits of polar tourism that accrue to the wealthy few who can afford polar travel and the changes to

the Arctic environment that threaten residents and the ecosystem alike. Into this mix are added questions related to last chance tourism (travel to see places and people affected by climate change before they are “gone”), the desire of communities in these regions to engage in economic opportunities such as tourism, and the contribution of tourism to environmental and cultural changes already occurring through these other global forces (Dawson et al. 2011; Eijgelaar et al. 2010; Lemelin et al. 2010). The interaction of local and global forces in polar tourism requires careful consideration of ethics for operators, tourists, governments, and other stakeholders if the hope of sustainable tourism is to become reality.

## Political Philosophy and Business Ethics

Cristina Neesham<sup>1</sup> and Rob Macklin<sup>2</sup>

<sup>1</sup>Swinburne University of Technology,  
Melbourne, Australia

<sup>2</sup>University of Tasmania, Hobart, Australia

## Synonyms

Governance; Normative Ethics; Political Science; Political Theory; Professional Ethics

## Definition and Introduction

In this discussion, we consider political philosophy as a branch of philosophy studying the way human communities and societies create and maintain various forms of governance for the good of constituent individuals and groups. Governance as a system of conducting the affairs of the *polis*, i.e., the participating community of citizens, is the basis of society’s political life. Hence, political philosophy is the practice of thinking reflectively about the nature of governance, political institutions, and power, understood as a constitutive factor in the relationship between governing and being governed.

Ontologically, political philosophy is concerned with the nature of political systems and relations, and of the values and principles that may be governing them. Epistemologically, the focus of political philosophy is on the role of

knowledge and ideas in structuring people's understanding of political purpose, legitimacy, and authority. Allied with normative ethics, political philosophy engages in appraisals of past and existing governance arrangements and their impact on the wellbeing of societies, communities, and individuals – by reference to some ideal of the good. It also conceptualizes and evaluates proposals for the future of human communities and societies, using normative principles such as justice, rights, needs, equality, desert, responsibility, freedom, and life chances.

Topics of central interest in political philosophy include:

- The (tacit or explicit) social contract between citizens in a *polis*, as a fundamental principle that makes social and political order possible.
- Forms of government of the *polis*, in particular the sources and principles of governing citizens, and the use of power and statecraft in international relations.
- Private and public property, and the rights and responsibilities that governments have in relation to both.
- The rights and liberties, duties and obligations of citizens, as well as how citizenship is defined and articulated.
- Authority and legitimacy, i.e., their nature, forms and grounds, and their manifestation in various political orders, from democracy to totalitarianism.
- The role of public discourse and ideology in structuring political relationships and outcomes in a community.

As a key political influencer and decision maker, business plays an increasingly important role in shaping today's mainstream philosophical perspectives on how communities, local, national, and global, should be governed. It is therefore imperative that the ethics of business practices be informed, as much as possible, by the most advanced and enlightened thinking political philosophy has to offer.

## Description

The business ethics literature has sought to address and apply all the topics mentioned above in order to illuminate the mutually influencing relationship between business and the polis. For example, it has discussed: business as bound by social contracts; corporate governance as a political process mirroring those practiced in the wider society; interactions between private property and labor as sources of capital and issues of corporate ownership; corporations as citizens and the nature of corporate citizenship; corporate legitimacy and authority, and the scope and limits of democracy in organizations; and organizations as networks of power relations and loci of ideological control. The main arguments raised in each of these discussions are outlined below.

## Social Contracts, Hypernorms and Business Ethics

The social contract is a core concept in political philosophy, developed by a long series of prominent thinkers – from Hobbes (1651), Locke (1689), and Rousseau (1762) to Rawls (1971) and Gauthier (1986), among others. The notion of a social contract, understood as a nexus of implicitly agreed norms by which people (individuals and groups) live together in society, has for centuries provided a framework for explaining and justifying: (1) what private interests should be sacrificed in order to promote more fundamental liberties for all citizens; and (2) why more comprehensive forms of governing structures (such as governments) should be accepted, in order to oversee and enforce such norms. Inspired by this tradition, Donaldson and Dunfee (1994) established an integrative social contracts theory (ISCT) as a normative theory of ethics in and for business. The application of ISCT to business activity helps us identify and understand the “ties that bind” businesses – in other words, their social, political, and moral obligations to the wider community and its citizens. The theory is integrative because it articulates *microsocial contracts*, i.e., agreements on ethical behavior in business, as established between members of a particular economic community, with

*macrosocial contracts*, i.e., hypothetical agreements on how economic activities should be carried out using moral norms that belong to the wider community. Further, the norms that emerge through genuine agreement between businesses as economic agents in a particular context are bound by universal moral principles called *hypernorms*, which set the ethical criteria for evaluating all other norms.

ISCT has gained wide acceptance across business ethics. However, some commentators argue that ISCT, like other social contract approaches, places too much reliance on the assumption that moral reasoning can be free of the encumbrances of everyday life (Frederick 2000). A variety of alternatives has been proposed, including communitarian, discourse, and dialogic approaches contending that political reasoning cannot be abstracted from historically embedded cultural values and norms (Macklin and Mathison 2017).

### **Corporate Governance as Political Process**

Discussions of corporate governance go to the purposes of organizations and how they should be governed in pursuit of these purposes. Increasingly, relevant analogies are drawn between governing organizations and governing nation states, societies, and markets. Specific to corporations, of significant concern is the political role and status of shareholders. The orthodox position identifies the maximization of shareholder value as the primary principle of governance (Cragg and Matten 2011). Nevertheless, increasing numbers of authors are challenging any sole focus on shareholder supremacy, arguing that managers have ethical duties towards a range of other stakeholders, including employees, consumers, and the environment (Freeman et al. 2010). These discussions raise questions of principle about the responsibility that senior managers and boards have towards potentially vulnerable groups.

### **The Role of Property and Labor as Sources of Capital and Corporate Ownership**

Allied to discussions of corporate governance is a debate that involves business ethics in the relationship between labor and capital. The question of what governance role and rights employees

should have in an organization has been raised following observations about the dominance of capital owners, rather than labor owners, in governing the productive organization. Traditional conceptions of corporate governance support a share-ownership model for justifying governing power – to the extent that, if employees are to be involved in the governance of the firm, they should be shareholders (Jensen and Meckling 1979). Alternative arguments (see Boatright 2004) use the language of political rights to cast ownership as attaching to a right to the revenue produced by organizational activity. As labor power is an asset that employees invest in firms, it implies ownership and, as such, a right to some share of revenue. Primarily, employees exercise a governance role through their right to shape the terms and conditions of their employment.

Opposing the liberal tradition of political economy, Marxist labor process theory (LPT) reverts the capital-labor balance in the ownership debate almost entirely in favor of labor, emphasizing its central role in generating revenue and ultimately driving economies. According to Marx (1867), and later LPT, a logic of capital accumulation drives owners of capital to continually seek new ways to produce goods and services more effectively and efficiently. This urge to revolutionize the labor process is portrayed as driven by incessant competition between capitalists, as well as between capital and labor. Because of the indeterminacy of labor, employees can, however, resist efficiency drives and act autonomously. Consequently, owners of capital through the agency of managers will continually seek new ways to control the activities of labor (Thompson and Vincent 2010). Given employers' relative power vis-à-vis employees, this results not only in the exploitation of workers but also in ongoing structural antagonism between capital and labor. To understand and improve on current corporate governance arrangements in capitalism, it is therefore important to examine how the frontiers of capital's control of labor at the workplace are constructed and sustained (Edwards 2010). Ethical managers, therefore, not only have to make decisions that uphold workplace justice and mitigate the effects of exploitation but also have to face up to this

structural antagonism as an ongoing source of workplace conflict and ethical dilemmas.

### Corporate Citizenship: Political Theories of Corporate Social Responsibility

Applications of political philosophy to organizations, industries, and markets portray corporations as types of political communities requiring strategies and techniques aimed at internal governance. An emergent body of literature focuses on the outward-facing political role of corporations in global and societal governance. While organizations have often been regarded as political actors in societies, alongside other groups such as trade unions and community groups, they have usually been considered as primarily independent from the state. In western democracies, the state tends to be cast in the role of governing pluralist societies for the greater good, which requires that it should mediate the contending claims of different groups, including corporations.

However, the once-clear division between the economic role of business and the political role of the state is now blurred. It is argued that business firms, driven in part by globalization, are increasingly taking on governance tasks in and across societies. The erosion of the nation state's capacity to regulate economies, particularly given the influence of globalized financial markets, is creating a gulf that corporations are voluntarily seeking to fill. By doing so, they attempt to regulate their activities and pursue ends in ways that contribute to the common good. This development has been named political CSR (Scherer et al. 2014).

Political CSR cannot be seen in purely instrumental terms: in some cases, corporations are acting as social innovators for the public good, and not just pursuing private interests narrowly and simplistically conceived. However, the emerging role of corporations in the *polis* raises important questions about the risk posed by current corporate governance structures to democracy and democratic institutions (Scherer et al. 2014). With respect to this risk, both Friedman's warnings about the ability of corporations to competently pursue non-economic ends (1970) and Marxist-inspired arguments that fundamentally

question the genuine interest of multinational corporations in leading the way towards the public good become relevant.

### Corporate Legitimacy, Authority, and Democracy

In political philosophy, legitimacy is defined as adherence to voluntarily (albeit often tacitly) agreed norms of social, political, and moral behavior by those who are to live by these norms. Public authority, such as that of government over its citizens, is then justified on the basis of such norms (Rossi 2014). Legitimacy is the foundation of laws, which in turn combine with the free, voluntary support of the citizens to confer on the state the authority it requires in order to govern. One of the recurrent questions political philosophy has sought to answer is: what form of social-political order (and therefore government) is most appropriate for maintaining an optimal relationship between legitimacy and authority? In theory at least, democracy has been preferred to autocratic government (Keane 2009).

Applied to the ethics and social responsibility of business, the concepts of legitimacy and authority have been discussed in relation to principles of discourse ethics and deliberative democracy, as outlined through Habermas's (1987) theory of communicative action. Corporate legitimacy is thus analyzed as the outcome of deliberation processes whereby the purpose of achieving legitimacy should be moral (i.e., providing strong reasons for a foundational social good) rather than cognitive (i.e., satisfying public perceptions) or pragmatic (i.e., satisfying powerful stakeholders). In line with this purpose, corporations (multinationals in particular) are increasingly expected to engage in public justifications of their actions in a permanent dialogue with society and its stakeholders (Palazzo and Scherer 2006). Corporate executives are therefore drawn to reflect on ethical questions that are closer to political philosophy than to business management. A key skill of the executive resides in integrating the two and translating this hybrid perspective into coherent, legitimate, successful corporate action.

## Power Relations, Governmentality, and Corporate Ideology

The role of power in social and political relations has been a constant preoccupation in political philosophy. For contemporary theories of organizational management and control, Foucault's concepts of pastoral power (2000), disciplinary power (1975), and governmentality (1991) are seminal. His ideas have provided business ethics thought (as well as related empirical research) with a solid theoretical foundation for exploring the impact of institutionalized forms of power on individual autonomy, the construction of the subject in organizations (especially through ideology and discourse), and the diffusion of governing action through socially accepted forms of knowledge and self-correction. In this context, ethics is not about enforcing the organization's institutionalized norms of subject construction: on the contrary, it is the space where critical reflection on such constructions and norms, by managers and subordinates alike, becomes possible and, consequently, it is the source of emancipatory change in power relations and business practices (see Ibarra-Colado et al. 2006).

Foucault-inspired investigations of dominant ideologies in organizations, advanced by critical management studies, have also led to new developments in business ethics. For example, human resource management research has been found to adhere to unitarist assumptions that portray organizations as sites of consensus and common objectives, editing out possibilities of legitimate discord and conflict (Geare et al. 2006; Greenwood and Van Buren 2017). Unitarism is not only an all-encompassing ideological framework determining how employers and employees do, can, and should understand and conduct their relationship. It also prevents researchers from challenging the foundations of their own theoretical frameworks and distorts the scope and limits of business ethics in both theory and practice.

## Summary

Theories and arguments advanced in political philosophy have often shaped central ideas and

debates in business ethics. Furthermore, philosophical explorations of concepts such as autonomy, responsibility, power, ownership, justice, rights, and discourse in the context of organizations and workplaces embedded in local, national, and global communities are likely to continue, to the benefit of both domains. Discussions of ISCT and its alternatives provide nuanced approaches to grounding political and moral norms in organizations, offering a fertile context of application for political theories. Philosophical questions about governance and ownership continue to shape analytical and normative discussions of how organizations in capitalist economies are and should be regulated. The emergence of political CSR and a political role for business executives can be seen as highlighting the centrality of corporations to the governance of global concerns such as poverty and the environment. Despite a widespread application of philosophical notions of power, ideology, and discourse in the study of management and organizations, business ethics as a critical field of inquiry is yet to develop an appropriate space for engaging with more recent, alternative advances in political philosophy – in particular, those adopted and developed in the emancipatory programs of feminist and postcolonialist research.

## Synonyms

Fraud; Scam; Shell game

## Introduction

A Ponzi scheme is a variant of a confidence scam, in which returns paid to investors are drawn not from genuine profits, but from capital provided by new investors. Investors are deceived into thinking that the returns are in fact genuine profits and they consequently reinvest (or “rollover”) their investment and/or encourage others to commit new capital to the apparently lucrative investment opportunity. Ultimately, however, if investors decide to withdraw from the scheme, or if the supply of new entrants falters, the scheme collapses as there is insufficient capital to continue paying the promised returns. As long as there are new entrants, however, Ponzi schemes can continue undetected for years, and even decades.

## Key Characteristics

Although Ponzi schemes are presented in a variety of forms, they all rely upon the separation of the principal (who provides funds for investment) and the agent (who supposedly invests these funds) that is characteristic of modern investment

practices. Where all such investments accordingly rely on a degree of trust between the principal and the agent, Ponzi schemes exploit this trust. In order to ensure continued support, the schemes must nevertheless take on the appearance of legitimate investments, and so considerable effort is taken to falsify statements and provide misleading information to existing and potential investors. As they entail the deliberate use of deception to achieve personal financial gain, Ponzi schemes are all clear examples of financial fraud.

There are a number of other features that are common to some, but not all Ponzi schemes. In many cases, Ponzi scheme operators specifically target members of a single identifiable group, such as professional association, religion, or ethnic heritage (and thus provide an example of “affinity fraud”). The operators may either fall within such a group themselves or they may pose as a member of the group in order to gain trust. By doing so, they are then able to rely on the heightened trust that members of the group place in each other, and when some members extol the benefits of the investment to others, this can more easily draw in new investors.

In order to maintain credibility, schemers often appear to be wealthy themselves, with enviable business acumen and connections. They sometimes also maintain legitimate business operations alongside the Ponzi scheme. In some cases, the scheme may itself begin as a genuine investment, but become a Ponzi scheme when the anticipated returns do not materialize and the agent then uses new capital to pay fictitious returns. To appear genuine, schemes deliberately adopt language and conventions that investors may associate with stability and reliability, such as the name of the company, the location of the offices, and the technical details of the investment itself.

While the promised returns themselves may sometimes appear to be obviously unrealistic, in many instances the returns promised are attractive in terms of their regularity and their ability to consistently outperform comparative investments. Ultimately, to continue to attract new investors, they need to only offer a more appealing risk/return trade-off than alternatives. The victims of

Ponzi schemes are accordingly widely drawn, from retirees with little knowledge of investments to international financial corporations with sophisticated investment credentials.

## **Schemers and Their Victims**

Although there has been a wide variety of Ponzi schemes, at different times and across different locations, it is possible to identify some similarities in the psychology of those who perpetrate Ponzi schemes as well as those who fall victim to them. As confidence tricksters, Ponzi scheme operators necessarily have the personality traits and skills required to convince potential investors that the scheme is both genuine and better than alternative investments. Furthermore, as the investors need to be assured that they are indeed receiving the advertised returns, the operator must build a positive relationship with each investor to ensure that trust is maintained over a substantial period of time.

Ponzi scheme operators, like other fraudsters, are often motivated by personal greed, and the desire to acquire greater wealth. The appearance of financial success can then assist in enhancing their credibility as investment managers. However, the persistence of Ponzi schemes (and the operator’s decision not to simply abscond with the funds) suggests that Ponzi scheme operators may also have a misplaced self-confidence, believing that they can either turn the scheme around (and make legitimate profits), or continue evading regulators indefinitely. Furthermore, given that some Ponzi scheme operators (including Bernie Madoff, see below) had already achieved significant financial success, it has also been suggested that operators have narcissistic tendencies, using the perceived success of the scheme as a means of obtaining personal approval, while displaying no empathy for their victims.

Regarding the victims, there are clearly some instances in which they enter the scheme out of a desire to “get rich quick,” without real consideration of the merits of the investment and whether the advertised returns are probable. However, in

all but the simplest of schemes, potential investors are presented with investment opportunities that appear to be genuine and that offer returns that are not unreasonable, but merely present a more attractive risk/return trade-off. Given that genuine investments are often complex, with investors having little real understanding of the underlying technicalities, it may be more appropriate to characterize victims as overly trusting than simply gullible. Measures to avoid Ponzi schemes therefore focus on identifying potential warning signs or “red flags” that may raise suspicion about the credibility of any investment opportunity (see, for example, US Securities and Exchange Commission [2013](#)).

### Pyramid Schemes and Ponzi Finance

Ponzi schemes are sometimes compared to Pyramid schemes, and there are indeed similarities, where both schemes involve the absence of a genuine investment/product, and some reliance on new entrants to the scheme. However, a Pyramid scheme, as the name suggests, is hierarchical in nature, where each new entrant has no prospect of any return unless he/she recruits two (or more) further entrants. Each new entrant to the scheme then pays a fee/commission to someone higher in the hierarchy. As Pyramid schemes rely on an exponential increase in entrants, they do not typically last long. Although some Ponzi schemes have used intermediaries, and they do require new investors (who may be attracted to the scheme based on the testimony of existing investors), the need for new investors is not exponential, and accordingly they have the potential to last for a longer period.

Reference is sometimes also made to Ponzi finance. This, however, relates to a risky approach to debt servicing, where interest is not paid from operations (the funds not having generated sufficient revenue), but from taking on further debt. While new debt may be available as long as the underlying assets increase in value, the system collapses when asset values eventually decrease. Although this Ponzi financing is unsustainable in

the long run, the practice does not necessarily involve deception and accordingly should not be considered fraudulent.

### Ponzi's Scheme

The term “Ponzi scheme” itself is taken from the scheme operated by Charles Ponzi in 1919–1920, through a company he started called the “Securities Exchange Company.” Ponzi developed an attractive investment opportunity that involved the purchase and exchange of International Reply Coupons, a means of prepaying international postage. These coupons could theoretically be purchased in Italy and then exchanged in the USA for postage stamps at a significantly higher rate. Taking advantage of a genuine arbitrage opportunity, Ponzi's scheme thereby had some credibility and he offered investors in the scheme a 50% return after 90 days. Ponzi did not however make any genuine attempt to purchase and exchange International Reply Coupons and proceeded to pay investor returns from capital invested. The payment of such returns to the initial investors led to an influx of new capital, allowing him to perpetuate the scheme. By the time the scheme collapsed, which in this case was not due to a lack of new entrants, but from suspicion regarding Ponzi's profit-making and subsequent enquiries with the Post Office, Ponzi had received approximately \$15 million from 400,000 investors (see Lewis [2015](#)). Ponzi was jailed in August 1920.

### Bernie Madoff

Although there have been a multitude of Ponzi schemes, the most well-known (and perhaps more well-known than Charles Ponzi's own scheme) is the scheme operated by Bernie Madoff from as early as the 1980s to 2008. Madoff had operated a successful securities investment company through the 1980s that had contributed to the development of the NASDAQ. However, from the late 1980s or early 1990s, Madoff began accepting and managing investments in a sideline operation. He

claimed to be able to generate consistently good (but not outstanding) returns over time, during both good and poor economic conditions, using a “split-strike conversion strategy.” Madoff did not, however, succeed in generating the required returns and began to falsify returns to his investors. Together with his history of business success, his connections within wealthy Jewish society and his use of intermediary “feeder funds” to bring in more new entrants, Madoff attracted investors that included A-list celebrities, high net worth individual and multinational institutional investors. By refusing to accept all prospective investors, Madoff created a further perception of being among the trusted elite.

Ultimately, however, the financial crisis of 2008 led to investors needing to withdraw their funds, and the scheme’s collapse. US Prosecutors estimated that a total of \$64.8 billion was invested into the scheme, related to 4,800 client accounts (Graybow 2009).

## Pragmatism and Business Ethics

Andrew B. Gustafson

Creighton University, Omaha, NE, USA

## Definition

Pragmatism is the view that experience is the basis of our knowledge and that beliefs and theories prove themselves insofar as they work and make sense of the world, so our knowledge is ongoing and developing.

## Introduction

Pragmatism is a philosophical approach rooted in the American thinkers William James, Charles Saunders Pierce, and John Dewey among others, and has more recently found champions in thinkers such as Richard Rorty and Hilary Putnam. Classic pragmatists insisted that theory must arise from practice, not abstract principles. This is why pragmatism, which is rooted in empirical experiences and practical consequences of ideas and actions, is frequently contrasted with idealism, which tends to discount material experiences and focus on immaterial ideas and ideals.

For the pragmatist, all of our knowledge is rooted in our coherent accounts of our experiences, and all of our beliefs are refinable and must be examined, and are liable to change as we progress in our understanding of our experiences. Pragmatists have, one could say, an approach to discovering truth much like a scientist – it is through ongoing testing of hypotheses that we come to a clearer and clearer understanding of how the world is. Our theory about a particular concern today may change tomorrow – or need to be discarded entirely – due to new experiences (experiments). We tell coherent and believable stories about our experiences of the world, and through this we gain beliefs which help us to make sense of our experiences. As our experiences continue and our pool of experiences

grows, so too does our knowledge. None of us has a “God’s-eye viewpoint” from which to decide whether our beliefs are correct – we only have our combined and shared experiences (and history of others experiences) to turn to when deciding what is “true.”

Business seems to have at its core an essential pragmatic approach (in the common meaning of that word) to decision-making – namely: what works? Throughout business, we find problem solvers – managers, salespeople, suppliers, and frontline employees who are confronted with problems and try to find the best available situation given the circumstances in which they find themselves. Evaluating the customer, or the particular market segment, or the particular community needs of the consumers, and so on, is fundamental for the business to make decisions about what is the right decision. And business learns from experiences from the past – economists, marketers, and financial advisors forecast the future based on the experiences up to this point. Business theories and practice change and develop over time, not only due to new knowledge from the past, but new situations in the future – such as the current innovations of AI technology and data analytics. And the theory is directly connected to the experiences and practice. In this way, business is fundamentally pragmatic.

### Elements of a Pragmatic Business Ethic Approach

In light of the fast-changing technological changes in our contemporary world, it seems that the pragmatists attention to our progressing experiences and knowledge would possibly help us to make decisions in the business world; and in light of the globally diverse situations which businesses experience more and more in their decision-making, it seems that the pragmatists awareness of the contextual and cultural situatedness of perspective could assist as well (Pouryousefi and Freeman 2021).

A pragmatist approach to business ethics would not try to derive practices from transcendental mystical notions of truth, but rather would

derive concepts from experience itself so that concepts are linked to practice, and practices, rather than abstract norms, would serve as the source of social norms (Pouryousefi and Freeman 2021; Gustafson 2010). Charles Saunders Peirce, an early pragmatist, emphasized that our view of truth is limited, since we have a finite and fallible perspective, given that our experiences are limited, obviously, by our own experiences. He conceived of all scientists (and all inquirers) as part of a community attempting to bring the various pieces of the puzzle together in a long march towards a gradually improving understanding of, and gradually improved theories and hypotheses about, reality. We accept new beliefs as true, because they fit with our other beliefs. And occasionally we have to make significant alterations or “scientific revolutions” from one set of beliefs to another, such as the Copernican revolution (Kuhn 1962).

A pragmatist approach to business and business ethics will not try to discover the one sole principle or silver bullet or key to unlock the mysteries of management practices. Kant’s categorical imperative will not provide the single and complete principle by which to make all of one’s management decisions. Mill or Bentham’s greatest happiness principle (utilitarianism) will not finally help reveal the fullness of clear and precise decision-making for all circumstances. The pragmatist business ethicist expects that, since values are derived from our experiences, they will come from the bottom-up, rather than a top-down approach ala the abstract-principles-applied approach. Again, theoretical mind experiments about the original state of nature (Hobbes) or a veil of ignorance (Rawls) will not be the best source of values and concepts which can work – experience itself and examining the real consequences of particular actions will be the most useful basis for determining norms and values to direct management practices, according to the pragmatist. The pragmatist sees the attempts by utilitarians or Kantians or contractarians to apply their principles to real lived experiences as backwards, and an act of contortion, attempting to see how to make practice fit the principle, rather than deriving the principle from the experiences.

Stakeholder theorists Wicks and Freeman in particular have argued that a pragmatic approach fits well with a stakeholder approach, which attempts to hear out the various competing voices of stakeholders to contextually develop solutions which make sense for the parties involved. This localism of decision-making which in some real sense muddles through to a right answer in light of previous and recent experiences of a particular set of stakeholders seems to be what might attract stakeholder theorists to the pragmatic approach. In their *Stakeholder Theory: The State of the Art* (2010), Freeman et al. provided an overview of stakeholder theory and claim that at the center of their approach is what they describe as “pragmatic experimentation.” At the end of the book, they recommend that “if we adopt what we called in Chapter 3 pragmatic experimentalism, we can make our ideas about business more useful and hence worthy of being taught to managers and future managers.” Freeman and Wicks had developed this more fully in their previous work (1998) where they attempted to distinguish a pragmatic approach from an anti-positivist account. The anti-positivist, they say, claims the following:

1) There is no way of getting outside of human experience to describe reality; 2) facts and sentences are intertwined—meaning, that our language plays a role in how we view the world and what we consider to be true. In some sense, facts are in part artifacts; 3) Inquiry is always narrative and interpretive. We cannot observe experiences without some already set ideas and expectations of what to look at/look for/ see; and 4) Science is itself a language game, with pre-set rules and expectations. It is not in any pure sense ‘objective’.

Wicks and Freeman claim that this anti-positivism leads to relativism and an anything-goes approach, which is not helpful in progressing. They claim a pragmatic approach works better than traditional positivism or the anti-positivist approach, insofar as the pragmatic experimentation is purposeful – attempting to solve problems at hand, rather than settle meta-questions of metaphysics or epistemology. They suggest the acknowledging that there are multiple interpretations of phenomena is important, but that this need not lead to an “anything goes” approach. The pragmatist also will see

organizations as social and acknowledge that all the individuals of an organization share and create meaning out of their experiences. Again, the source of value is bottom-up – from the humans involved in the process, and as they work through new experiences and understanding as a community. Practically, Freeman et al. (2010) lay out five pragmatic principles which should affect the way business ethicists do their research:

1. Multiple interpretations: We need to consider the merits of multiple perspectives of phenomenon and evaluate them for their usefulness to solving problems.
2. Importance of conceptual framing: We should be very aware of how language can hide implicit assumptions and skew our perspectives as we draw our conclusions.
3. Strengthen the theory-practice link: Our theory needs to be well connected to real practice, and theory will become more valuable as a resource to practice, the more they are connected.
4. Multiple methods and forms of evidence: We should not assume any particular field or discipline has the corner on helpful insights and solutions. We should shop widely across perspectives and disciplines to seek answers to the problems at hand.
5. Direct linkage of ethics and mainstream management literature: We need to break down the imaginary separation between ethics and business practice, and management scholars must see the moral aspects of their theories, and ethics scholars need to better understand the business implications and applications of their theories more realistically and concretely.

More recently, Pouryousefi and Freeman (2021) claim that a pragmatist approach to business ethics (particularly one derived from Richard Rorty) has some distinctive imperatives. First, a pragmatist business ethicist would be willing to take on a public role with a focus on morally progressive action, rather than being an “armchair philosopher.” This would involve seeking solidarity with others, and seeking conversation partners to learn from outside of your typical circle of interlocutors. This emphasis on freedom and

openness of encounters is an essential foundation of the approach.

Rather than expecting radical transformations to overcome injustice and exploitation, the pragmatist would work towards piecemeal reforms which help gradually empower individuals more and more. The solutions to problems must arise from within the context of the problems, and the solutions need to arise from the problems, not from abstract principles, and somehow merge with our other beliefs.

Additionally, there will in a pragmatist approach be a focus on what is useful, rather than what is “true.” A pragmatist will typically call a belief true if it is useful to believe, has been acquired through inquiry and examination, and seems to make sense of shared experiences of the community. Abstract truths which do not seem to make sense of our world are to be left aside, since what the pragmatist wants are concrete solutions to real problems.

Interestingly, the notion of truth on a pragmatist account is intimately connected with the pragmatists view of agency. Our freedom to choose leaves us with responsibility and possibility – even the possibility to make statements true or false. William James, another classic pragmatist, was famous for his concept of truth. In some sense, we can help make things become true. The statement “I will lose 20 pounds by Christmas” may or may not be true – but the power to make it true or false rests in large part with me. A company logo that “We are the best place to work in Omaha” is only as true as that company decides to follow through with real practice to back up the logo. In this sense then, we help determine what comes to be true.

Finally, a pragmatist does not see ethical duties or obligations as a result of reasoning or logic, rather, our ethical obligations arise from moral intuitions. Obligations arise from moral sentiments, but those come almost spontaneously to us, not by reasoned judgement. We simply know certain things are wrong, and often it is our lived experience in a particular moment which helps us to “know” the reality of that truth. It is one thing to read about people being mistreated or violated or placed on a trolley track to be run over by a trolley –

it is quite another thing to witness such an event. Moral conviction in experience is rarely derived from arguments or abstraction.

## Potential Criticisms of Pragmatic Business Ethics

Although the pragmatist approach to business ethics is in its early stages of development, it has gotten significant criticism in the business ethics community.

Many ethicists feel that Rorty and other pragmatists frequently set up a “straw man” philosopher/business ethicist – as though philosophers and business ethicists go around with one abstract principle and forcing it onto the world, ignoring practical experience and knowing nothing about business practice, ignorant of the limits of their perspective. That is certainly not the case, and philosophers since Plato have been well aware of their limits and ignorance of the totality of things. Ethics has always been a practical and ongoing project. As Richard T. DeGeorge has put it, “[Ethics] is an attempt to make sense of our individual and collective moral experience. In the process those engaged in it clarify terms, analyze arguments and presuppositions, attempt to make the system of moral judgments more consistent than it usually is, try to fill voids in our intuitive reactions to new processes and social developments, and provide reasons for action such that people can engage in fruitful discussion or argument in pursuit of the common good” (DeGeorge 2006). In other words, ethics is and always has been a practical and engaged process, full of starts and stops, providing responses to new developments and aiming to bring about fruitful discussion in the community of inquirers.

Regarding the pragmatic intuitionism: One of the first criticisms of an intuitionist approach – be it pragmatic or otherwise – is that we all know that frequently people’s moral intuitions conflict. Ethics has traditionally been the practice of reflecting on one’s beliefs and intuitions, and sorting out the wheat from the chaff – through reasoning. That is not to say all of ethics is derived from reasoning, but reasoning plays an important

part nonetheless. But even Rorty accepts that rational argumentation plays a role, only he thinks it plays a subsidiary role to the imagination: “Rational argumentation about moral issues always lags behind. Reason can only follow paths that the imagination has broken” (Rorty 2006). Intuitions are certainly a place to start perhaps, although intuitions alone will not get one far.

Some argue that the abstract principles the pragmatist claims to reject are necessary for their own program to get off the ground. It seems difficult if not impossible to have a program of pursuing *better* understanding, or *better* ways of doing things, if you don’t have some understanding of better or worse – even a notion of the good itself – to help you make such judgements. A pragmatist could, presumably, admit that they do have a finite and fallible notion of what is better and worse in a given instance, and that general principles can be derived from previous experience (my own and that of the community of humanity throughout history), albeit a likely flawed and impermanent working notion for now, which will hopefully be improved upon over time. Anyway, one need not know the pure and unsullied truth and goodness of the universe to know that vanilla ice cream generally tastes better than dirt (and conversely, that tomatoes planted in dirt produce much better than those planted in ice cream) or that living unmolested in peace is preferable to being tortured. Intuitions and shared experiences can get us that far at least as we try to find useful solutions.

Another related criticism is that if the pragmatist’s (at least Rorty’s) goal is to persuade and convince others to see the world they do through persuasive rhetoric, but there is no particular convergent consensus oriented around an expectation that there is something we can all come together to find out, then it seems that education is not a leading to any truth, or enlightenment, but all education is just indoctrination – me trying to get you to think about things the way I do. If this is all there is to “teaching,” one might agree with Daryl Koehn’s assessment of such a view when she says “Teaching the liberal arts loses its

nobility and becomes just another politically instrumental game. If that is all that teaching is, I find it hard to conceive why one would bother to get up in the morning and prepare for class” (Koehn 2006). This criticism may not fully realize the deep rootedness of communal inquiry which pragmatists seek. Surely learning can take place in an environment of hearing multiple voices and attempting to understand various perspectives, and teaching can become a facilitating of that sort of learning environment.

A final criticism and concern is that perhaps pragmatism will not be able to provide the kind of basis to bring about clear change – the attempt to try to bring out values simply from the practical experiences of business might lead to a support of the status quo, and fail to criticize business and capitalism as necessary, or to the degree required. There is no doubt that a pragmatic approach, being piecemeal and gradual, will not typically be revolutionary, but it still may find much in common with more critical approaches to business (Visser 2019).

What pragmatism might have to say to business ethics and how it might aid management theory is still an open, if developing, question, but there has been some interesting work done in recent years suggesting some possibilities about how pragmatism might be useful to business ethics and it remains a very fruitful and interesting field of study in the literature.

## Precautionary Principle and Resource Extraction

Jim Cooney  
Institute for the Study of International  
Development, McGill University, Montreal, QC,  
Canada  
Keevil Institute of Mining Engineering,  
University of British Columbia, Vancouver, BC,  
Canada

### Introduction

The standard definition of the precautionary principle is stated as Principle #15 in the 1992 Declaration of the Rio Conference on Environment and Development: “In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.”

The precautionary principle relates to the environmental risk assessment of resource extraction projects and the role of government in setting environmental performance standards through

regulation of oil, gas, and mining operations. The challenge is that the quality and reliability of environmental risk assessment is continuously evolving based on scientific advances and on experience gained from the occasional failures of regulations to prevent serious environmental damage. Additionally, the cost-effective measures to prevent environmental degradation continue to evolve with advances in technology. Notable examples of evolution in predicting and controlling the environmental impacts of resource extraction can be found in the ongoing regulatory advances related to acid rock drainage, tailings impoundments, and greenhouse gases. Thus, in practice, governments are always in the position of setting regulatory standards within the current constraints of full scientific certainty and the current state of cost-effective measures to prevent environmental degradation. Even with state-of-the-art (sometimes referred to as “world class”) environmental regulations, resource extraction always retains the risk that an unexpected and presumably low probability event could cause serious and possibly irreversible environmental damage.

Critics of resource extraction sometimes take the position that projects should proceed only when there is zero risk of negative environmental impacts. Their definition of the precautionary principle is: “When in doubt, don’t,” a position that clearly would have the effect not only of eliminating virtually all resource extraction projects but also of preventing the learning about environmental risks that occurs through progressive regulation based on scientific and technological advances. From an ethical perspective, the zero risk position prompts reflection on the distribution of resource extraction risks and benefits within the context of the overall common good of society: Are there societal benefits from resource extraction sufficient to justify some degree of environmental risk tolerance, and what would be the relevant criteria and norms for such a justification? Ethical questions also arise about the relative accountability and liability of resource extractors and government

regulators in the event that a low probability but high impact environmental disaster should actually occur in spite of an operation's full regulatory compliance.

Some resource extraction companies and industry associations, concerned about the consequences if a low probability but high impact event should occur even if their operations are fully compliant with government regulations, have developed and implemented voluntary precautionary approaches of self-regulation that expressly go "beyond regulatory compliance." One motivation for resource extraction companies to implement voluntary precautionary approaches of environmental self-regulation is the high level of concerns of local communities that stand to be the most adversely affected groups in the host jurisdiction in the event of an environmental disaster. Industry associations are motivated to mandate the implementation of precautionary approaches of environmental self-regulation out of a collective concern that an environmental disaster on the part of one company affects the reputation of all companies in the industry.

The Mining Association of Canada has taken a lead in developing and promoting the implementation by all of its members of a precautionary approach to environmental performance that goes beyond regulatory requirements. The "Towards Sustainable Mining (TSM)" protocols of the Mining Association relate to: greenhouse gas emissions, tailings management, biodiversity conservation, safety and health, and other subjects of concern. The TSM initiative is designed and updated collaboratively by members of the Mining Association together with representatives of the industry's "communities of interest" (which include aboriginal and non-native communities, nongovernmental organizations, governmental agencies, industry investors, suppliers to the industry, and other concerned constituencies). A common feature of industry-initiated precautionary approaches, including the TSM protocols, is the mandating of periodic independent external verification or

audits of the performance of individual resource extraction operations with respect to specific subjects of concern. In some cases, resource extraction operations have established permanent panels of technical experts, community representatives, and others, commonly referred to as oversight or surveillance committees, to maintain a high level of continuous vigilance over a subject of environmental risk of particular concern.

## Press Freedom Index (PFI)

Alex C. Michalos  
University of Northern British Columbia, Ottawa,  
ON, Canada

## Synonyms

Freedom of the press; Index of press freedom; Measuring press freedom; Press freedom assessment; Press freedom measure; Press freedom scale; World Press Freedom Index

## Definition

The Press Freedom Index (PFI) is a standardized measure of “the level of freedom available to the media throughout the world” (Reporters Without Borders 2019a).

## Description

One of the world’s oldest moral maxims tells us that we must always speak the truth. While most people accept it as asserting a moral obligation, it is unclear as to whether or not most people accept its corollary that we must always actively pursue the truth before we speak. The active pursuit of the truth is normally a necessary condition of knowing what is true. Those who speak the truth without good reasons are lucky, but the institution of morality cannot reasonably be left to good luck, and the obligation of due diligence in the pursuit of truth cannot be neglected in favor of luck (Michalos 1995, 2017).

The Greek tragedian Aeschylus (c. 525–456 BCE) said that “In war, truth is the first casualty.” He assumed that peace normally thrives on truth, on people knowing what is true or false and why. In liberal democracies it is generally assumed that a free press in the broadest sense of news media makes an essential contribution to citizens’ knowledge of what is true or false. Additional contributions are made by institutions of formal and informal learning, scientific research, governments, NGOs, families, and so on. Reporters Without Borders (2019a) reminds us that:

There can be no freedom of thought without knowledge of reality. In 1948, the United Nations said in Article 19 of the Universal Declaration of Human Rights that ‘freedom of opinion and expression’ implies the right to ‘seek, receive and impart information and ideas through any media and regardless of frontiers’. . . . Whatever the political system, it cannot reflect divergent interests and internal contradictions without independent watchdogs capable of challenging established authority. . . . Independent journalism is therefore crucial for a ‘high intensity’ democracy.

The PFI was created by the NGO Reporters Without Borders in 2012 to provide citizens of all countries with some means of measuring the levels of freedom of one important source of truth, news media in all its modern forms. It combines qualitative and quantitative information into a single index ranging from the best score 0 to the worst score 100. In 2019 there were 180 countries assessed with this index. Online questionnaires with 87 items translated into 20 languages were sent to 1208 experts distributed across all the countries according to their population sizes, ranging from 2 to 22 experts per country. Generally speaking, the experts consist of media professionals, lawyers, and sociologists, mostly journalists, and each year about a third of the respondent group is new.

Items of the questionnaire are sorted into seven subindexes referred to as “criteria categories” or “indicators” as follows.

1. “Pluralism. . . measures the degree to which opinions are represented in the media.” For example, yes or no, “In your country, do any of the following exist?
  - (a) Privately owned print press.
  - (b) Privately owned television networks.
  - (c) Privately owned radio stations.”
2. “Media independence. . . measures the degree to which the media are able to function independently of sources of political, governmental, business and religious power and influence” e.g., on a ten point scale, “How easy is it for authorities to force the firing of a . . .
  - (a) public radio or TV journalist,
  - (b) public radio or TV executive,
  - (c) private media executive.”
3. “Environment and self-censorship. . . analyzes the environment in which news and information providers operate”, e.g., on an 11 point scale, “During the past 12 months, have you seen any of the following actions directed at journalists by government or religious authorities or major economic interests, or by interest groups linked to any of them?

- (a) Public discrediting,
  - (b) public insults,
  - (c) hate speech.”
4. “Legislative framework. . .measures the impact of the legislative framework governing news and information activities”, e.g., yes or no, “Does a legal mechanism exist to protect the confidentiality of journalists’ sources?”
  5. “Transparency. . .of the institutions and procedures that affect the production of news and information”, e.g., on a ten point scale, “Is the process for granting TV and radio licences transparent?”
  6. “Infrastructure. . .measures the quality of the infrastructure that supports the production of news and information”, e.g., Which of the following response categories best describes the situation in your country? “Do individuals who want to provide news online have access to high-speed Internet at a reasonable price?
    - (a) Access is widespread.
    - (b) Access is guaranteed in principle but not everyone enjoys it.
    - (c) Access is not guaranteed and many do not enjoy it.
    - (d) Access is limited to a very few.”
  7. “Abuses. . .measures the level of abuses and violence.” In what Reporters Without Borders (2019a) calls its “Annual Round-Up”, “country and regional level” data for this indicator are produced by its in-house research team using a scale of 0 = best to 100 = worst score.

The final PFI is constructed with two parts. For each country, the first part is the sum of unequally weighted scores on the first six indicators, and the second part is the score on the Abuses indicator. “A country’s final score is the greater of these two scores.” Because (like golf) low scores are preferable to high scores, this aggregation method prevents countries from obtaining good scores because “news and information is tightly controlled.”

The possible scores ranging from 0 to 100 are divided into five sets to make their meaning intuitively easier to understand. A “good situation” applies to a score of 0–15 points, “satisfactory” to

15.01–25, “problematic” to 25.01–35, “difficult” to 35.01–55, and “very serious” to 55.01–100. In 2019, there were 15 (8%) countries with Press Freedom Index scores indicating a “good situation,” i.e., Norway (7.82), Finland (7.90), Sweden (8.31), the Netherlands (8.63), Denmark (9.87), Switzerland (10.52), New Zealand (10.75), Jamaica (11.13), Belgium (12.07), Costa Rica (12.24), Estonia (12.27), Portugal (12.63), Germany (14.60), Iceland (14.71), and Ireland (15). Another 28 (15.5%) countries had “satisfactory” scores, 66 (36.7%) were “problematic,” 52 (28.9%) were “difficult,” and 19 (10.7%) were “very serious” (Reporters Without Borders 2019a, b). Reporters Without Borders (2019a) reports that “At the turn of the century, nearly half of the world population still lacks access to free information.” In fact, as we have just seen, three quarters of the world has “problematic,” “difficult,” or “very serious” access to free information.

(The author expresses his thanks to Prem Samy of Reporters Without Borders for his help in clarifying some aspects of the construction of the index.)

## Professional Ethics in Healthcare

Bojan Borstner<sup>1</sup>, Helena Blažun Vošner<sup>2</sup> and Smiljana Gartner<sup>1</sup>

<sup>1</sup>Faculty of Arts, University of Maribor, Maribor, Slovenia

<sup>2</sup>Community Healthcare Center dr. Adolf Drolc Maribor, Maribor, Slovenia

### Synonyms

Ethical values; Health ethics; Healthcare ethics; Professional ethics; Virtue ethics

### Definition

Professional ethics in healthcare encompasses personal and corporate standards of behavior expected from healthcare professionals.

### Introduction

With a rapidly changing world and new advanced technologies come many ethical challenges in the healthcare sector that influence patients, their families, and healthcare professionals. In the past, there were many ethical discussions; however, none of them provided ranking classification of the most controversial ethical dilemmas that would result in their prioritizing and proper solving (Breslin et al. 2005). Nevertheless, ethics and its values, together with professional and responsible behavior of individuals, provide a basis for healthcare practice, and only recently, there have been efforts to define and categorize public health ethics as a public health research area (Slomka et al. 2008). Consequently, there is a need for the development of competencies for professionalism with the focus on the population as well as on the individual. Because healthcare professionals face ethical challenges on a daily basis in the course of their work, there is a need to reflect on, discuss, and give renewed attention to ethics and professionalism. In this way, all stakeholders of the

healthcare system can be appropriately prepared to solve ethical dilemmas in clinical practice and be able to perform ethical decision-making (Slomka et al. 2008).

### Healthcare Ethics

Ethics comprises knowledge about moral behavior and deals with issues of what is right and wrong, conflicts, ethical dilemmas, and their possible solutions on the basis of a legal justification. Health ethics is specifically focused on understanding clinical medical decisions and actions in healthcare settings, research and policy, and on providing action guidelines when ethical dilemmas or conflicts occur (World Health Organization 2015). Healthcare ethics can be further divided into medical ethics, nursing ethics, and bioethics. While medical ethics and nursing ethics are based on ethical conflicts that occur in clinical settings and are associated with the implementation of healthcare for a specific patient, bioethics is a much broader term and refers more to ethical implications and applications of health-related life sciences (Dawson 2010; World Health Organization 2015; Michigan State University, College of Human Medicine 2018). Moreover, healthcare ethics is focused on ethical dilemmas that concern healthcare professionals as well patients, their families, health policy makers, and communities in various situations related to health, i.e., clinical care, healthcare systems, health services, advanced information technologies, etc. (World Health Organization 2015).

### Healthcare Ethics in Practice

Patients and their families are facing many ethical dilemmas during healthcare treatment. Breslin et al. (2005) identified top ten ethical challenges that the healthcare system is faced with, namely: disagreement with medical treatment decisions, waiting lists, healthcare resources for the elderly, those with chronic and mental illnesses, shortage of doctors in rural and urban locations, medical errors, termination of life-sustaining treatment

of terminally or seriously ill patients, obtaining consent, ethical issues in conducting research, decision made by an appointed substitute, and ethical issues in surgical innovation and in applying new medical technologies. Breslin et al. (2005) also found that among all challenges listed, the least attention is given to the top ethical issue, i.e., disagreement with medical treatment decisions, and proposed a few solutions for this issue. The most important is an appropriate education of the healthcare professionals, with a special focus on communication skills and the ability to understand the patient's perspective. The second step would be a creation of healthcare institutional policies (i.e., establishing associations for their members, establishing codes of professional ethics and conduct, and establishing ethics committees) in a manner that would provide a mechanism for solving disagreements between patients and healthcare professionals. In spite of the fact that previously a research on patient-centered quality improvement strategy for severely ill patients with the focus on the patient's perspective was performed, there is still a need for a better understanding of the patient's perspective (Singer et al. 1999; Powis et al. 2004). Still, future research should focus on the patient's perspective regarding medical decisions in relation to healthcare treatment (Breslin et al. 2005). Lastly, it is of the utmost importance to keep the public informed, not only because of the information itself but because the public, if involved in the process itself, could be a part of the solution to the problem and could, in this way, importantly contribute to the creation of healthcare.

## Ethical Issues in Healthcare

In healthcare practice and policy, an enormous number of ethical dilemmas exist which not only cover confidentiality, truth-telling, informed consent, autonomy, and freedom to decide on the individual's medical treatment but also other important issues, such as beneficence, (social) justice, solidarity, equity, reciprocity, and trust. Irrespective of the number of approaches to healthcare ethics, there is a strong collective action to the commitment "primum non nocere,"

i.e., "first, do no harm." Non-maleficence as an ethical principle is protecting the individual from harm and needs to be the highest attainable standard of health (World Health Organization 2015). It is a fact that practically every healthcare decision made by the physician or other healthcare staff has, on the other hand, ethical implications either for patients, providers, or healthcare managers. Within those decisions, various issues appear, and there has been a discussion which most influentially impacts healthcare staff and patients. According to Larson (2013), these issues are connected with the following:

1. Balancing healthcare quality and efficiency.
2. Ensuring basic healthcare access to all people.
3. A next very important issue is associated with healthcare organization of chronically ill and increasingly aging population; therefore, it will be necessary to provide appropriately educated, competent, and compassionate healthcare personnel.
4. It will also be necessary to address end-of-life issues.
5. Allocation of medication and donor organ shortages.

Advanced technologies have a very substantial impact on medical processes and clinical practices of healthcare professionals and can significantly improve quality of life. With technological innovations, we can replace paper records with electronic healthcare records which can improve general public health, provide valuable healthcare data for healthcare professionals and researchers, impact medical knowledge advancements, bring healthcare to people living in remote locations, and much, much more (American Institute of Medical Sciences & Education 2018). Since the fact that telemedicine represents remote delivery of healthcare services (World Health Organization 2009), thus bringing many advantages, it is necessary to think about legal and ethical issues. The first and by far the most important one is establishing a good relationship between the patient and the physician in order to establish mutual trust required to implement quality healthcare. Healthcare workers must deepen a holistic study of patients in order to

understand their values and living situations and receive all the required information connected with their medical issues (Kaplan 2016). The fact is that telemedicine is changing the communication between patients and their caregivers or family members affecting diagnosis and treatment decisions. According to Kaplan (2016), it is important that policies include the roles of healthcare workers and their responsibilities related to telemedicine with the aim to ensure patient safety and ethical workplaces. Especially important is to address the issues such as privacy, patient safety, autonomy, and protection and, above all, to include patients in designing various telemedicine services. This is necessary in order to ensure ease of use of the applications that will be able to serve all patients.

## Ethical Decision-Making and Professional Roles

Ethical decision-making is based on ethical principles and methods. Some moral decision-making methods answer the question “What should I do?” and therefore focus on the rightness of the action, while others answer the question “What kind of person should I be?” and therefore focus on the (character/nature of) agents. In the field of healthcare, most commonly used methods are utilitarianism (Mill 1998), nowadays closely connected with economical rationalism and the concept of efficiency; deontology (Kant 1989), evaluating the agent’s action according to ethical obligations and duties; principlism (Beauchamp and Childress 2009), providing four ethical principles, rules, virtues, moral rights, and emotions of so-called “common morality”; and the virtue ethics (Aristotle 1985), the right path to moral behavior is the cultivation of certain virtues. By doing so, the attention of ethical reflection is shifted from action to human and to questioning what kind of person we must be and what qualities we must have in order to act morally as well as to evaluate the whole of the individual’s behavior, not individual actions (Spielthener 2017). The ethics of care (Gilligan 1982; Noddings 1982) focuses on (intimate) relationships, caring, love, empathy, and compassion. According to

Held (2006), for the rest of the methods, objectivity and justice are one of the main features in decision-making, excluding care and love. The ethics of care focuses on interpersonal relationships, where care (as a practice and as a value) and justice are included but have different priorities.

### Synonyms

Anthropology of postsocialism; Cultural anthropology; Ethics in anthropology; Fieldwork; Observation with participation; Social anthropology

### Introduction

Social and cultural anthropology is a scientific discipline with elaborated professional ethics. Development of social and cultural anthropology in the twentieth century opened several important questions, connected with ethical standards in anthropological research and fieldwork, with methods used in anthropological fieldwork (especially with observation with participation), with use of field results in anthropological publications (in scientific journals, anthropological monographs, etc.), and with use of results of anthropological research in everyday practices (social practices, political practices, etc.), as well as questions connected with theoretical and epistemological dimensions of social and cultural anthropology. Most of these questions have been opened in the second half of the twentieth century.

In the last half of the twentieth century, standardization of ethical principles, connected with

anthropological fieldwork and with use of results of anthropological research in publications, everyday practice, etc., has become obligatory part of anthropological profession. This can be seen through the fact that almost every association of social and/or cultural anthropologists elaborated a professional ethical code which equips social and cultural anthropologists with explicit ethical standards and instructions how to practice their professional activities (AAA 2009, 2012; AAS 2012; AIATSI 2020; ASA 2020; ASAA/NZ 2016; ASUK&C 1999; ABv 2018; BAA 2005; UGAT 1978; WCAA 2012). Some other organizations, for example, the European Union, also elaborated ethical codes for professional activities in anthropological research (Iphofen 2013). These ethical codes show not only problems which are of basic importance in social and cultural anthropology when professional ethics is in question, but also which solutions of these problems have become a kind of ethical professional standards in social and cultural anthropology.

### Short Historical Overview

The first who discussed questions connected with professional ethics in social and cultural anthropology was Franz Boas, who at the beginning of the twentieth century opened a question if cultural anthropology has been used to cloak espionage among native populations (Boas 1919).

From Boas' contribution till the 1970s discussion about ethics in social and cultural anthropology got several different directions: first, theoretical discussion how ethics could be understood in social and cultural anthropology (for example, Beals 1969); second, anthropological research of ethics in different native populations (for example, Brandt 1954); third, ethical implications of cultural relativism (for example, Herskovitz 1973); and fourth, ethical dilemmas about government-founded anthropological research. In the USA, pre-World War II generation of anthropologist regarded connections of anthropological research with military and intelligence services as ethical neutral and/or ethical

acceptable (Price 2004). This cooperation was understood as part of the fight against Nazism, communism, and totalitarianism (Price 2004). Post-World War II generations of anthropologists understood these connections as unacceptable prostitution of professional activities for monies and prestige, and as betrayal of the natives whose welfare anthropology had claimed to cherish (Fluehr-Lobban 2008).

In the 1960s and 1970s, questions of welfare and interests of researched peoples have become the most important topic of professional ethics in social and cultural anthropology. The critique of Vine Deloria, Jr., Sioux (1969) urges anthropologists to reflect the effects of their work and to assume a helpful hand in relation to problems of Indian people. Anthropological debate about relationships between anthropology, Western politics, and colonialism also addressed several important questions connected with professional ethics in social and cultural anthropology (Asad 1975).

Since 1980, "ethics in relation to informants" (Akeroyd 1984) has become the most important topic in discussion of professional ethics in social and cultural anthropology. In this period, anthropological organizations and associations adopted ethical codes to elaborate professional responsibilities of social and cultural anthropologists in relation to researched peoples (AAA 2009, 2012; AAS 2012; ASA 2020; ASAA/NZ 2016; ASUK&C 1999; ABv 2018; BAA 2005; UGAT 1978; WCAA 2012).

In the end of the twentieth century and at the beginning of the twenty-first century, several important questions connected with professional ethics in social and cultural anthropology have been (re)opened in postsocialist countries. Discussion was opened if introduction of professional standards of Western social and cultural anthropology into postsocialist social and cultural anthropology should be understood as a special type of Western colonialism (Kürti and Skalník 2009).

In 2007, UN adopted *United Nations Declaration on the Rights of Indigenous Peoples* (UN 2007). This declaration represents internationally valid standards for study and research of Indigenous peoples. As such, it has had important

impact on every study of Indigenous peoples, also on anthropological fieldwork and on professional ethics in social and cultural anthropology. Despite general principles of the declaration are in accordance with professional ethics in social and cultural anthropology, some principles require even more elaborated ethical standards than those earlier practiced in anthropology. Some anthropological ethical codes have already been adopted to declaration's ethical standards (AIATSIS 2020).

### **Ethical Standards in Contemporary Social and Cultural Anthropology**

In contemporary social and cultural anthropology, ethical aspects must be taken into account in all forms of anthropological activities, theoretical and practical. Different ethical codes introduced elaborated ethical standards for different aspects of anthropological professional activities (see AAA 2009, 2012; AAS 2012; AIATSIS 2020; ASA 2020; ASAA/NZ 2016; ASAUUK&C 1999; ABv 2018; BAA 2005; UGAT 1978; WCAA 2012).

#### **Ethical Standards Regarding Fieldwork**

Anthropological fieldwork as a basic anthropological research method has been connected with complex ethical dilemmas from Franz Boas (Boas 1919) till today. In past debates, fieldwork was connected not only with Western colonialism, but also with instrumentalization of studied peoples for anthropologists' professional career and for the development of Western social and cultural anthropology. Vine Deloria, Jr., Sioux stressed racist and colonial elements in anthropological fieldwork and stood for future cooperation between anthropologist and native Indians which should be "honest, sincere, equal" (Deloria Jr. 1969: 78). To enable such cooperation, debate was opened on how to guarantee appropriate relation with and responsibility to research participants (Akeroyd 1984).

In contemporary social and cultural anthropology, obligatory part of different professional anthropological codes are ethical principles which regulate relation with and responsibility to

research participants (see AAA 2009, 2012; AAS 2012; AIATSIS 2020; ASA 2020; ASAA/NZ 2016; ASAUUK&C 1999; ABv 2018; BAA 2005; UGAT 1978; WCAA 2012). The most important ethical principle of this relations is: "Do no harm!" (AAA 2012). In this respect, anthropologists' ethical obligation is to avoid negative consequences of their research on researched participants: "In their work, anthropologists' paramount responsibility is to their research participants. When there is a conflict of interest, these individuals must come first. Anthropologists must do everything in their power to protect their physical, social, and psychological welfare and to honour their dignity and privacy" (ASAA/NZ 2016). In the year 2009, ethical code of AAA extended these obligations also on animals and natural surroundings of anthropologists' fieldwork (AAA 2009). "In all stages of the research, from design, through fieldwork and analysis to dissemination, anthropologists need to respect the well-being (safety, dignity, and privacy) of humans and other species. They need to avoid harm or wrong to the people, non-human species and materials they study or work with (or that are in any other way related to the research context)" (ABv 2018). AIATSIS (2020) pointed out that research projects "should be designed and conducted in a manner that respects Indigenous peoples' right to maintain their connection to Country and to control, protect and develop their lands and resources." When these ethical principles are "in conflict with the goal of generating databand seeking new knowledge ... anthropologists should consider to refrain from or discontinue a research project, or to exclude particular data from disclosure" (ABv 2018).

For realization of this ethical standard, anthropologists practice several activities: protect research participants, anticipate harms, honoring trust, avoid untrue intrusion, guarantee rights to confidentiality and anonymity, etc. (AAA 2009, 2012; AAS 2012; AIATSIS 2020; ASA 2020; ASAA/NZ 2016; ASAUUK&C 1999; ABv 2018; BAA 2005; Iphofen 2013: 41–45; Van der Geest 2011; WCAA 2012).

The second basic ethical principle of anthropological fieldwork is avoiding instrumentalization

of research participants for interest of Western anthropologists and Western social and cultural anthropology. Anthropologists' basic ethical obligation is to be "sincere to . . . host community and . . . to explain to them the objectives and implications of his research" (UGAT 1978). Researched participants "have the right to be fully engaged in any processes, projects and activities that may impact on them" (AIATSIS 2020). "As far as possible anthropologists should try and involve the people being studied in the planning and execution of research projects" (ASA 2020). Even more, anthropologists "should seek joint status for the researcher and researched participants in planning and executing the research as far as feasible" (Holcombe 2020: 2).

In this regard, anthropologists' ethics obligation is to negotiate and achieve informed consent before starting fieldwork (AAA 2009, 2012; AAS 2012; AIATSIS 2020; ASA 2020; ASAA/NZ 2016; ASUK&C 1999; ABv 2018; BAA 2005; UGAT 1978; WCAA 2012). This means that anthropologists have to achieve researched participants' informed agreement with purpose(s) of study, anticipated consequences of the research, identity of sponsors and funders, anticipated uses and sharing of the data, with possible benefits, harms, or discomfort that might affect participants, with data storage and security, with degree of anonymity and confidentiality which may be afforded to researched participants, and with other aspects of field research (AAA 2009, 2012; AAS 2012; AIATSIS 2020; ASA 2020; ASAA/NZ 2016; ASUK&C 1999; ABv 2018; BAA 2005; UGAT 1978; Iphofen 2013: 41–45; Van der Geest 2011; WCAA 2012). Part of anthropologists' professional duty is also to avoid any exploitation of research participants, so "fair return should be made for their help and services" (ASA 2020). Anthropologists must be aware that researched participants have the right "to refuse to participate in the research" (BAA 2005).

Anthropologists should also "recognize that their obligations to the participants or the host community may not end (indeed should not end, many would argue) with the completion of their fieldwork or research project" (ASA 2020).

### **Ethical Standards Regarding Application and Dissemination of Research Results**

When research results are in question, basic anthropologists' ethical obligation is to guarantee researched participants' "right to have access to research results" (BAA 2005). In application and dissemination of results of anthropologists' fieldwork, anthropologists "have an ethical obligation to consider the potential impact of both their research and the communication or dissemination of the results of their research on all directly or indirectly involved" (AAA 2009). Their ethical obligation is to organize such use of research results which will do no harm to researched participants, nonhuman species, and materials they studied. To realize this goal, anthropologists "must weigh the intended and potential uses of their work and the impact of its distribution in determining whether limited availability of results is warranted and ethical in any given instance" (AAA 2009).

To prevent the use of data that could be harmful to researched participants, "anthropologists should be the owners of their research data. Researchers should make every effort to avoid the transference of this ownership to other persons or institutes, or to open access data bases" (ABv 2018). Anthropologists should store their data securely (ABv 2018).

Some ethical codes open also a problem of researched participants' intellectual property rights (AAS 2012; AIATSIS 2020; ASA 2020; ASUK&C 1999; BAA 2005). In this regard, anthropologists' ethical obligation is to guarantee research participants' intellectual property rights over in fieldwork-collected data (AAS 2012; AIATSIS 2020; ASA 2020; ASUK&C 1999; BAA 2005).

### **Ethical Standards Regarding Responsibility to One's Own and to Host Government**

Doing fieldwork, anthropologists must know that "there may be numbers of national laws or administrative regulations which may affect the conduct of their research" (ASA 2020), i.e., which may regulate conditions of access, cross-national research, open research, and other aspects of their fieldwork (AAA 2009, 2012; AAS 2012;

AIATSIS 2020; ASA 2020; ASAA/NZ 2016; ASAU&C 1999; ABv 2018; BAA 2005; UGAT 1978; WCAA 2012). Anthropologists' ethical obligation is to practice their fieldwork in accordance with host and their own national laws or/and administrative regulations (Akeroyd 1984). In relation to host and their own government, anthropologists' ethical obligation is to be "honest and candid ... Specifically, no secret research, secret reports, or secret debriefings of any kind should be agreed or given" (ASAA/NZ 2016). Anthropologists should "seek assurance that they will not be required to compromise their professional and scholarly responsibilities as a condition of being granted research access" (ASA 2020). They should be also aware that in principle "social research data are not privileged under law and may be subject to legal subpoena" (ASA 2020).

#### **Ethical Standards Regarding Relation with and Responsibility to Sponsors, Funding Agencies, and Employers**

Anthropological research is frequently connected with sponsors, founding agencies, and employers. In this regard, part of professional ethics in social and cultural anthropology are ethical standards connected with obligations to sponsors, funders, and employers, with clarifying roles, rights, and obligations, with negotiating "research space" and with relations with gatekeepers (AAA 2009, 2012; AAS 2012; AIATSIS 2020; ASA 2020; ASAA/NZ 2016; ASAU&C 1999; ABv 2018; BAA 2005; UGAT 1978; WCAA 2012). In this regard, anthropologists' most important ethical obligation is not to "enter into agreements with sponsors which do not allow them to withdraw their services on ethical grounds" (AAS 2012). Among other ethical obligations toward sponsors and founders, anthropologists' ethical obligations are to "come to explicitly arrangements with sponsors before commencing work" (AAS 2012), not to "accept anthropological work which they are insufficiently qualified to do, whether by way of training or experience" (AAS 2012), and to "respect the confidence of sponsors" (AAS 2012).

#### **Ethical Standards Regarding Relations with and Responsibilities Toward the Discipline, Scholarship, Science, and Colleagues**

Anthropologists have also complex ethical obligations toward anthropological discipline, scholarship, science, and colleague. Professional ethical standards regulate, for example, individual responsibility, conflict of interests, consideration for colleagues, shearing research materials, collaborative and team research, responsibilities toward research student and field assistants, etc. (Akeroyd 1984; AAA 2009, 2012; AAS 2012; ASA 2020; ASAA/NZ 2016; ASAU&C 1999; ABv 2018; BAA 2005; UGAT 1978; WCAA 2012). In accordance with professional ethics in social and cultural anthropology, anthropologists must be aware that "anthropological researchers are subject to the general moral rules of scientific and scholarly conduct: they should not deceive or knowingly misrepresent (i.e., fabricate evidence, falsify, and plagiarize), or attempt to prevent reporting of misconduct, or obstruct the scientific/scholarly research of others" (AAA 2009). Another basic ethical obligation is to share willingly their knowledge "as a means of improving the general standard of anthropological knowledge, theory and practice" (AAS 2012). Anthropologists have also "duty to be informed about ethical codes relating to their work" (AAS 2012) and not to "compete with other anthropologists for employment in a way which may be detrimental to professional standards" (AAS 2012).

#### **Ethical Standards Regarding Responsibility to the Wider Society**

Part of professional ethics in social and cultural anthropology are also anthropologists' responsibility to the wider society: "Anthropologists should use the possibilities open to them to extend the scope of social inquiry, and to communicate their findings, for the benefit of the widest possible community" (AAS 2012). In so doing, anthropological ethical obligation is to "consider the likely consequences of their research practice for the wider society, groups within it, and possible future research" (AAS 2012), and to "consider

carefully the social and political implications of the information they disseminate” (AAS 2012). In relation to wider society, anthropologists’ ethical responsibility is also responsibility to widen the scope of social research (AAA 2009; ASAA/NZ 2016; ASUK&C 1999) and maintaining professional and scholarly integrity (AAA 2009, 2012; AAS 2012; ASA 2020; ASAA/NZ 2016; ASUK&C 1999; BAA 2005; UGAT 1978; WCAA 2012).

### Ethical Standards Regarding Teaching

Also anthropologists’ teaching activities are guided by elaborated ethical principles and standards (AAA 2009, 2012; AAS 2012; AIATIS 2020; ASA 2020; ASAA/NZ 2016; ASUK&C 1999; ABv 2018; BAA 2005; UGAT 1978; WCAA 2012). Because relations between anthropologists as teachers and mentors and students are complex, there exist also complex ethical principles which regulate different aspects of these relations. In teaching activities, anthropologists should, for example, “preclude discrimination on the basis of sex, marital status, ‘race’, social class, political convictions, disability, religion, ethnic background, national origins, sexual orientation, age, or other criteria irrelevant to academic performance” (ASUK&C 1999). Anthropologists as teachers/mentors should “strive to give students, trainees and interns or junior colleagues in joint projects an excellent anthropological education” (AAS 2012), “impress upon students/trainees the ethical challenges involved in every phase of anthropological work” (ASUK&C 1999), “should not engage in exploitative relationships with their students” (AAS 2012), “should not be involved in sexual liaisons with students, trainees or interns for whose education and professional training they are responsible” (AAS 2012), and “should be receptive and responsible to the needs, problems and aims of students in relation to their educational career in the field of anthropology” (AAS 2012). In their publishing activities, “teachers/mentors should publicly acknowledge student/trainee assistance in research and preparation of their work” (ASUK&C 1999).

### Open Problems

Despite elaborated professional ethics in social and cultural anthropology, several ethical problems and dilemmas remain open.

An important group of open problems relates to covert studies in anthropology (Iphofen 2013: 34–36; Venkatesh 2008). In situations, connected with danger, risk, and violation of law, anthropologists can conduct their research only in form of covert studies (Iphofen 2013; Venkatesh 2008). Part of covert studies are deception and lying which are from the perspective of described professional ethics in social and cultural anthropology unacceptable. However, in some situations this is a necessary precondition for realization of anthropological research (Iphofen 2013). For example, Venkatesh could not have conducted his research on hustlers, prostitutes, and drug dealers if they had been aware of the research (Venkatesh 2008). In such situations, the question “is not simply whether it does or does not use deception, but whether the amount and type of deception are justified by the significance of the study and unavailability of alternative (that is, deception-free) procedures” (Kelman 1967 in Bynner and Stribley 1979: 190).

Another group of open problems is connected with ethnocentrism of professional ethics in social and cultural anthropology (Ross 2020; Van der Geest 2011). Professional ethics in social and cultural anthropology includes ethical principles and standards, which are important and acceptable for Western societies and cultures. In many non-European societies and cultures, there exist very different ethics and ethical standards which cannot be combined with or which are in open opposition with professional ethical standards in social and cultural anthropology. In such situations, practicing professional ethics of social and cultural anthropology means violation of native ethics and ethical standards, what is in opposition with professional ethics in social and cultural anthropology (Van der Geest 2011). In such situations, anthropologists have ethical obligation to “ground the anthropological Principles in regionally meaningful values” (Ross 2020: 5).

Harmonization of Western professional ethics in social and cultural anthropology with native ethics of native peoples is complicated in demanding process. In some cases, this harmonization has already resulted in codes of ethics, which are acceptable for native peoples, as well as for Western social and cultural anthropology (AIATSIS 2020; UN 2007). However, also in this process some problems are still open, for example, how to guarantee coexistence of emic (i.e., native) and ethic (i.e., anthropologists') understanding of research problems in cases where natives do not agree with understanding and evaluation of researched problems and questions, given by social and cultural anthropologists.

## Professionalism Versus Commercialism in Audit

Carolyn MacTavish

Lazaridis School of Business & Economics,  
Wilfrid Laurier University, Waterloo, ON, Canada

### Synonyms

Audit versus non-audit services; The business of accounting

### Introduction

Professional Accountants (PAs) acting in their professional capacity owe a duty of trust to their clients and users of their services.<sup>1</sup> At the same time, PAs run a business and strive to be financially successful, focusing on profit maximization. These dual objectives may come into conflict when the PA's financial incentives conflict with their fiduciary responsibilities, resulting in a professionalism versus commercialism conflict. Professionalism is particularly important for PAs in the auditing area because users of audit services place a high reliance on PAs to be objective and

provide an unbiased opinion on the company's financial statements. Stresses on the profitability of the audit can increase the pressure on PAs to keep costs down, which could result in short-cuts and reduced audit quality. PAs' focus on profit increases the potential for ethical breaches caused by possible conflicts between professionalism and commercialism.

This article highlights the importance and foundations of professionalism in accounting, focusing primarily on PAs who provide external audit services, that is, the audit of the financial statements of the corporation. Commercial pressures facing PAs and increases in these pressures are articulated to establish the existence of, and the conflict between, professionalism and commercialism. In order to maintain the value and credibility of the auditing profession, professional values must be safeguarded, and to this end, mechanisms are provided to swing the pendulum away from a focus on commercialism, towards a dominance of professionalism.

### The Need for Audit

Regulators in the major capital markets worldwide require a mandatory audit for publicly listed companies. For private companies, there is more variation across countries. For example, Canada and the United States do not require an audit of most private companies, whereas in the UK, many private companies over certain thresholds are required to have an audit. Other than for regulatory purposes, why do companies need an audit? Management, or those running the business, have detailed knowledge of the business operations and the financial results of the operations which are presented in the financial statements. Outside investors and creditors do not have the same knowledge or access to the internal financial records of the company. However, for these outsiders (third parties) to rely on the financial statement of the business, they need assurance that the numbers that management provides are credible and have been prepared in accordance with appropriate accounting standards. A solution to this problem is to use independent auditors to

<sup>1</sup> This responsibility is generally referred to as a fiduciary duty in common law jurisdictions. The fiduciary duty is one of the highest duties recognized for specific types of relationships. It imposes a legal obligation to act honestly, in good faith, and only in the best interests of the client while avoiding all conflicts of interest (Smyth et al. 2016).

provide assurance on the reported financial statements. These PAs are independent of the company and usually report directly to the shareholders of the company. Independent PAs are an important safeguard to ensure the financial statements are a “true and fair view” of what is happening inside the company (FRC 2014).

Investors and creditors rely on PAs for assurance on financial statements, yet they have no means of ascertaining if the PA has performed a quality audit. What is audit quality? Despite claims in the audit research that we know what audit quality is, very little is known about actual audit quality in practice. What we do know is that audit quality is difficult to measure. Regulators have expressed this concern, “There is no single agreed definition of audit quality that can be used as a standard against which actual performance can be assessed” (Financial Reporting Council (FRC) 2006, 16). Executives, even with their intimate knowledge of the company, cannot ascertain if they have been provided with a quality audit. It is virtually impossible for outside analysts, creditors, or the investing public to determine audit quality. Instead, regulators and users of the financial statements rely on professional standards and accounting professionals’ ethics to safeguard audit quality.

## Professionalism and Commercialism in Audit

Generally Accepted Auditing Standards (GAAS) are the “rules” that auditors must follow when performing an audit. These standards are broad, and there is significant professional judgment involved when conducting an audit. Just as there is “choice” when deciding how to account for a particular accounting issue, there is also choice in how to conduct an audit; that is, there is usually no single correct audit approach. There are many degrees of latitude given to accounting firms when planning, gathering, and interpreting audit evidence, to support the Audit Report.

Accounting firms offer a wide variety of services, only one of which is auditing. While auditing is conducted by professionals who owe a duty to the

users of the financial statements, PA firms tend to view all aspects of their portfolio through a profit lens. A focus on the commercial, or profit side, can have a very harmful effect on the professional role, particularly for auditing. It is important to look back at the history of the accounting profession and the evolution of auditing through the decades to identify factors that may have contributed to an increased shift from professionalism to commercialism in audit.

## The History of Auditing

The leading historian of the accounting profession, Dr. Steven Zeff, has analyzed the changes that have happened to the US profession throughout history. This section is drawn substantially from his analysis. Although Dr. Zeff’s analysis was based primarily on the US experience, the pressures facing the profession are global in nature.

In the early 1900s, PAs were seen as social trustees in positions with a public duty and derived their value sets from fiduciary logic. In the 1940s, accounting firms were relatively small entities. New hires in the firms graduated from accounting programs that had focused on professionalism and the accounting code of ethics. They were then immersed in professional behavior within the firms themselves (Wyatt 2004). Firms slowly began growing throughout the 1950s and 1960s through acquisition of and mergers with smaller firms. Firms prided themselves on taking tough positions on accounting standards, without regard to revenue or clients (Wyatt 2004). Partners demonstrated their commitment to professional values by speaking out on the issues of the day, often without consideration to their clients’ individual circumstances – it was about what they felt was “right.”

In the early to mid-1960s, a change of focus in the audit profession began. This shift in focus could not be blamed on one incident, but rather on a number of factors that caused a gradual shift in the profession over the next few decades. For example, the acceleration of corporate mergers and creation of international conglomerates, the commodification of auditing, and the explosion of consulting

services were all significant pressures that changed the face of accounting firms. Thus began the movement from a focus on professionalism to a focus on commercialism. Using this corporate logic, public accounting firms began negotiating accounting treatments with their clients rather than promulgating the most appropriate treatment (Zeff 2003b).

The corporate merger movement of the 1960s led to large multinational companies, with substantial pressures within these large conglomerates to show increasing profits (Zeff 2003a). Executives increasingly began to resent Generally Accepted Accounting Principles (GAAP) as they placed constraints on their choice of accounting methods. The standards might limit the profit the company could recognize, and in doing so also the executives' compensation which was often linked to the company's profitability. This caused an unprecedented public focus on accounting standards, which led to increased political lobbying and sometimes opinion shopping.<sup>2</sup> A former research and education partner of Price Waterhouse and the American Institute of Certified Public Accountants executive vice-president forcefully criticized the "opinion shopping" that was going on:

Competition to obtain a client for the lowest fee or to obtain or retain a client at the expense of technical standards is debilitating. It will weaken, and, if unchecked, destroy the profession. Competition for a client based on accounting principles must be stopped. (Savoie 1968, 112)

During the next few decades, audit firms also began to consolidate in order to grow and ensure they had the resources available to meet the demands of the new international companies. They increasingly became "full-service" firms, providing not only auditing services but a full range of accounting and management consulting services as well. The audit began to be viewed as a commodity service, with many large firms that could all produce the same standardized audit

report. Management had little concern for quality, as audit quality was difficult to measure. Here the audit could be considered simply a tax on doing business. These factors led to downward pressures on costs, with savings coming in the form of reduced salaries and time spent on the audit. More time was devoted to tasks such as analytical review techniques and less time spent on time-intensive substantive test of details, resulting in lower-quality audits (Imhoff 2003). The courts increasingly held auditors not liable to third party users (investors in particular) and so there were less and less reasons for auditors to be worried about audit quality. Commercialism began taking its toll on the audit.

As audit fees were falling sharply, consulting fees were rising (Zeff 2003a). Initially these management advisory services were viewed as auxiliary to the audit – add-on services that were not separate engagements on their own. The profession defended these services as integral to understanding the client better, in order to provide a better quality audit. As these services grew in scope and dollars, there was less and less promotion of the accounting and audit functions within the firms.

Concern grew from outside regulators, academics, and accounting professionals not in the "consulting" business that the independent audit professionals were becoming less independent (Zeff 2003a; SEC 1978; POB 1979; Olson 1982). Firms were conducting more advisory and non-audit services and becoming more economically dependent on these big clients for highly profitable consulting work, and were sometimes in the position of having to audit their own consulting work. As fees grew, consultants gradually took over the political power within the firms. As a result, there was an obvious conflict of interest for the auditors. Would they truly present a non-clean audit report and risk the firm losing an important consulting client? The corporate logic was vividly portrayed in the 1980 address given by Wm. R. Gregory, outgoing chairman of the American Institute of Certified Public Accountants' (AICPA) Public Oversight Board:

<sup>2</sup>Opinion shopping is when company executives desire a particular accounting outcome and solicit the opinion of additional accounting firms who agree with their opinion and then switch to these auditors to gain the accounting outcome they desire.

It seems that the effects of the phenomenal growth in the profession and competitive pressures have created in some CPAs attitudes that are intensely commercial and nearly devoid of the high-principled conduct that we have come to expect of a true professional. It is sad that we seem to have become a breed of highly skilled technicians and businessmen, but have subordinated courtesy, mutual respect, self-restraint, and fairness for a quest for firm growth and a preoccupation with the bottom line. (quoted in Zeff 2003b, 267).

Fees continued to grow, until a full-blown crisis emerged in early 2000. The ethical lapses that took place within accounting firms contributed to the events surrounding Enron, WorldCom, Sunbeam, and similar corporate scandals. The political response was regulations that hit the profession, and hit it hard. In the USA, there was the passage of the Sarbanes Oxley (SOX) Act of 2002 and the creation of the Public Company Accounting Oversight Board (PCAOB) to audit the auditors. The Canadian regulators and the accounting profession issued their own version of SOX through new independence standards and creation of the Canadian Public Accountability Board (CPAB). European standards for auditor independence were modified and recommendations to adopt international standards on auditing were hastened, as well as establishing minimum requirements for public oversight of the auditing profession. Arthur Andersen folded shortly after its notorious audit of Enron.<sup>3</sup> A critical eye turned to the audit profession, questioning the professionalism of accountants.

With the regulatory changes, there was a temporary chill in PA firms' relationships with their clients. Firms divested their prohibited consulting practices. The new regulations arguably led to better behavior within the firms; however, the pressures have not gone away. Consulting practices are still at the forefront of revenue growth at the firms, and this persistence of the "non-prohibited consulting practices," coupled with the other pressures discussed, suggest the

professionalism versus commercialism debate will not be silenced anytime soon.

## A Resurgence in Professionalism

The return to a strong focus on professionalism is not beyond reach for the accounting profession. The regulatory changes and policies in the firms help, but more effective changes are needed. There is ongoing research by accounting academics, the profession, and regulators studying ways to ensure history does not repeat itself. All point to changes that will likely not reverse the course of history on their own, but together can take a step towards restoring the "professional" values of the profession (Wyatt 2004; Moore et al. 2006; PCAOB 2013; Coram and Robinson 2016). Three of the most obvious areas where change could occur are: within compensation plans, firm quality control, and limits on non-audit work.

### Compensation Plans

Compensation plans within PA firms can contribute to the commercialism focus when they emphasize commercial values and exclude professional values. Carcello (2005) finds that during the phase of increasing commercialism within the profession, the compensation plans in Big Four audit firms emphasized revenue growth and client satisfaction more than professional skepticism and audit quality (Carcello 2005; Wyatt 2004). The literature has identified significant risks of performance-based compensation (vs. a fixed or lock-step approach) to professional behavior in auditing firms and to how this may alter the core values of PAs.<sup>4</sup>

Critics and regulators have argued that more adequate incentives should be provided to those who display professional values or who are effective in their technical and professional

<sup>3</sup> Arthur Andersen was initially found guilty of obstruction of justice which was later overturned by the United States Supreme Court.

<sup>4</sup> A Lock-step approach is not solely determined by concerns for organizational efficiency but also by the values and standards appropriate to the organization (Coram and Robinson 2016, 33). This concept of lock-step has been completely removed from compensation schemes at the Big 4 (Coram and Robinson 2016).

performance (Wyatt 2004; Moore et al. 2006; PCAOB 2013). Incentive plans must incorporate measurement of quality performance, and then these quality performance incentives need to be incorporated, or incorporated more, into incentive plans, at professional firms (PCAOB 2013). In order to provide incentives for increased professionalism, firms need to reconsider their compensation policies, with a focus on technical and professional performance.

### Quality Control and Professionalism

Greater emphasis on quality control in audit performance within the audit firms themselves is needed. Firms do have processes already, but regulators, academics, and many within the profession are asking for more (Wyatt 2004). More effort should be devoted to ensuring that the financial statements of the organizations they audit meet the intent of the standards versus solely the letter of standards (avoiding the intent).<sup>5</sup> One way to achieve this is to change the tone at the top of the accounting firms. Managements' philosophy and practice within the audit firms themselves are often overlooked. Emphasis should be put on restoring the paramount importance of professional behavior in the conduct of services rather than focusing primarily on promoting revenue growth. The change needs to start at the top.

### Limiting Non-audit Services

The audit report must be from auditors who are *independent* from the company they are auditing. The CPA Code of Professional Conduct Canada (2016) establishes base-line conditions for independence by stipulating several prohibitions against practices that would violate independence. These are a good start; however, audit firms should always be striving to ensure they meet not only all the rules but also avoid any situations where there could be the *appearance* of a breach of independence. PAs need to remember that if it *appears* that they are not independent, then the value of the services provided diminishes, perhaps

to nothing. Bernard Z. Lee, a member of the Special Committee, the Institute's 1983–1984 board chairman, CEO of the major accounting firm of Seidman & Seidman, and self-described “hawk” on the subject discussed self-imposed restrictions the profession should implement. His words are still just as relevant today. He was quoted as saying (prophetically):

The profession is changing and change is necessary, but we need to approach it with caution and there needs to be reasonable limitation on what services we should be providing as a profession. There's a perception by our critics, Congress for one, that we may be sacrificing our objectivity if not our independence. If we do not limit the scope of services, then someone will do it for us. (Weinstein 1987, 50)

### The Professional Accountant

Ultimately, PAs have a fundamental responsibility to act in the public interest. Instead of focusing on a list of rules that should not be transgressed, training within both the education system and firms must focus on the fundamental principles governing a PA's conduct, such as maintaining professional competence and confidentiality of client information. Services should be performed with integrity and due care. Finally, PAs should conduct themselves as professionals, serve the public interest, and be objective.

The professional accounting firms have faced numerous and complex pressures in the war on professionalism. These pressures include, but are not limited to, giving in to corporate and individual greed, cultivating relationships with clients that may impair independence, using creative accounting techniques designed to skirt accounting standards and performing services that impair independence (Wyatt 2004). Regulations have been imposed and resulting changes within the firm have been implemented. However, without a real focus on professionalism and how audit firm culture should be modified to reflect these fundamental principles, there will be little lasting impact of these regulations. The pressures have not gone away, consulting services are still being offered, and conflict of interest situations will

<sup>5</sup> The shift to international auditing standards was also aimed at addressing this concern.

always arise.<sup>6</sup> PAs need to reconsider what is necessary to restore the accounting profession to the level of credibility that it once enjoyed.

## Property Rights

John Douglas Bishop

Trent University, Peterborough, ON, Canada

## Synonyms

Legal rights; Ownership of the means of production; Personal property; Private property

## Definition

If something is the private property of someone, then that person has rights with respect to that thing which other people and entities do not have and which they ought to respect. Property rights assert both moral and legal claims.

All discussions of property rights must keep in view a fundamental distinction between personal property and private property in the sense of the ownership of the means of production. Personal property includes your toothbrush, clothes, house, and car – anything you use for personal purposes

---

<sup>6</sup>The collapse of UK's Carillion in 2018 and calls for a break-up of the Big Four audit firms in the UK point to the continuance of these concerns.

and do not use to produce goods and services for sale. Private property includes the means of production such as land, natural resources, businesses, and financial assets like stocks, bonds, options, and so on. In this entry, private property generally refers to the private ownership of the means of production.

## Introduction

Property rights have the same *structure* as human rights, constitutional rights, or any other rights claims; that is, the rights-holder (who is usually referred to as the property owner in the case of property rights) has rights claims; other people and entities have a corresponding duty to respect these claims. The theory of rights is really a theory of the duties and obligations of others with respect to the rights-holders.

Clarifying property rights requires addressing several questions: What rights does the ownership of property confer on the owner? Who can own property? What sorts of things can be owned as private property? How are the nature and origins of property rights theorized? How are property rights distributed, and does it matter?

## What Rights Does the Ownership of Private Property Confer on the Owner?

This question is impossible to answer because an owner's property rights are whatever the law says they are. There are great many legal systems in the world including national legal systems, international treaty laws, state/provincial laws, municipal laws, and laws created by self-governing entities. Each legal system can consign different rights to property owners. Consider, for example, the simple concrete case of land which is often thought to include the right of the owner to exclude others and the right to determine use of the land. However, trespass laws vary greatly, and in many jurisdiction rights-of-way, public footpaths, ancient hunting or other rights, water rights, and

so on can affect people's rights of excluding others from the land they own. Or, to cite a modern instance, my neighbor's Wi-Fi and cell phone emanations enter my property all the time, and there is not much I can legally do to exclude them. Environmental regulations, building codes, zoning rules, agricultural restrictions, and a multitude of other laws can restrict owner's use of their own land.

There is no theory which explicates what rights property law ought to confer on property owners. This creates a major difference between property rights and human rights. In the case of human rights, ethical theory and declarations (especially the United Nations Universal Declaration of Human Rights) do specify what human rights people ought to have. If the laws of any jurisdiction do not respect those human rights, then we say that the law violates people's human rights. There is no corresponding theory or declaration of what property rights ought to be; there are no inherent property rights. The law defines what property rights are, and one can never argue that the law has defined property rights incorrectly or failed to respect inherent property rights. This does not mean that property laws cannot be unwise or cause social harm – rent controls are often accused of causing social harm, for example. Property laws can also be vague or out of date from a utilitarian point of view. If a person owns a piece of land, for example, do they own the airspace above it? Can they exclude camera-laden drones from flying over their property? How far up there they own? We need to find out current law or wait until new laws are passed to know. We cannot theorize such an issue.

## Who (and What) Can Own Property?

Historically, in many societies property was owned by families, clans, tribes, villages, communities, and other entities. All such group ownership requires cooperation and coordination; if those are not dominant, competition for the resources owned in common will lead to

overexploitation and destruction known as the “tragedy of the commons.”

A solution to this tragedy is needed in large modern societies and economies. The most common solution is to allow only individuals and individual entities to own property. Large-scale group ownership is accomplished by the simple legal expedient of creating a fictional legal entity, most commonly a corporation. The corporation, as a single entity, can own property, but such property is not the communal property of the corporation’s owners. The rights of the corporation’s owners are clearly defined in law.

There are some exceptions to this rule that all property is owned by single entities. Spousal law, partnerships, and contracts can create exceptions, but all of these have legal complexities. Corporate law, on the other hand, is highly developed and precise in most advanced economies.

A government (national, state/provincial, or municipal) can also own “private” property – private in the legal sense but not in the social and economic sense. Such property is not the common property of the people in the jurisdiction but is legally the property of the government entity that owns it. Very often such property is owned not by the government in general but by a legal entity which the government has established. A bridge, for example, might be owned by the Department of Highways, and a campus is often the private property of a university. The legal principle of ownership by a single entity is applied to government ownership of private property. However, even if government property is private property from a legal perspective, from a political, social, and economic perspective, private property often refers to the nongovernment ownership of the means of production. The debate over whether government should or should not own a particular sector of the means of production is usually considered under the terms “nationalization” and “privatization.” Whether nationalized or privatized, from the legal perspective, the assets remain the private property of either a government entity or a private corporation.

## **What Sorts of Things Can Be Owned as Private Property?**

There are so many things that can be owned that it is easiest to see the limits of property ownership by first noting the sorts of things that *cannot* be owned. Human beings cannot be owned; slavery is prohibited by international law and by commitments of the national governments of all member states of the United Nations. Illegal slavery still exists, and some legal practices such as confiscated passports can approximate some aspects of slavery, but these are issues of violated human rights, not property rights.

Many legal jurisdictions prohibit ownership of babies, human body parts, and genes, but there are exceptions, borderline cases, and legal disputes in this area. Animals, on the other hand, can be owned as pets or livestock, but the ownership of many species is banned because they are endangered, dangerous, migratory, or because captivity is cruel. There is currently a movement to end ownership by aquariums and zoos of highly intelligent social animals like whales and elephants.

Also generally un-ownable are the atmosphere, the weather, the sea, the water flow, the moon, Antarctica, and scenes of great natural beauty such as the Grand Canyon. Outer space cannot be private property, although geostationary orbits are assigned to national governments who can then lease them to corporations. Broadcast bandwidths are also generally considered the property of governments and are available to corporations only on a lease basis. In some jurisdictions mineral and petroleum rights are similarly available only by leasing from the government; in other jurisdictions, the owners of surface land also own the minerals and petroleum under their land.

Public infrastructure used to be mostly viewed as owned by the government, but the privatization trend has greatly changed that. There have always been private roads, schools, hospitals, and universities, but most such entities were considered as government owned until recently; and all such entities were always part of government-controlled transportation, education, and healthcare systems. Private roads, for example, are always connected to the public road system.

Some entire industries, railways in Great Britain, for example, were nationalized then sold back to private owners (although in the case of Britain's railways, there is now moment to renationalize them).

Considering things that can be owned, the simplest case concerns physical objects. This is my pen, my book, my computer, and so on. Usually, the rights conferred by ownership of an object are exclusive usage and freedom to dispose of the object by gift, sale, or destruction. An example of an exception would be a house with a historical preservation order that prevents the owner from destroying or renovating the building. Ownership of things can be either personal property (such as the objects listed so far in this paragraph) or private property in the sense of the private ownership of the means of production. Tools, trucks, machines, and whole factories can be privately owned. Some objects cannot be privately owned; for example, there are legal restrictions in most advanced countries on the private ownership of guns, explosives, and military equipment.

Land is often cited as the most obvious case of clearly defined property rights. Private ownership of land usually confers rights to exclusive usage and the right to determine usage. However, as noted above, trespass laws greatly vary, and property owners' rights are constrained by environmental, zoning, and many other regulations. It should be noted that the value of land to property owners is largely dependent on government's ability to maintain "peace, order and good government," on government-provided infrastructure (e.g., a new subway line can dramatically affect the value of nearby land) and on well-functioning complex social systems, most importantly, cities. Piketty (2014) points out that the dominant form of wealth in modern societies is urban land; wilderness land per acre, by comparison, has very little financial value to the owners.

In capitalist economies businesses can be privately owned. Except for micro businesses, most businesses are incorporated. Legally, the corporation is the owner of the property of the business which gives the corporation similar rights to human beings who own property. This includes the right of corporations to own other

corporations. Curiously, corporations are both owned property and the owners of property. This leads to the cascading ownership of corporations which own corporations which own corporations and so on for many levels. Many small corporations are owned by one or a few human beings, but many large corporations are often publicly owned in the sense that many people and corporations own their shares. The rights of the owners of businesses are generally a right to control the business and the right to any profits which the business may earn.

Financial instruments can be privately owned by human beings or corporations. Some of the most important financial instruments are debt, bonds, mortgages, treasury bills, options, and other instruments bought and sold on financial exchanges. The property rights of creditors who own debt instruments are generally a right to some part of future cash flows. For example, creditors who own consumer debt have a claim on the future wages, salaries, and other incomes of the debtor. Creditors who own treasury bills and other government debt instruments have a claim on the future tax and other incomes of the government. Corporate bond owners have a claim on the future income of a corporation. Most financial instruments can be bought and sold freely on financial markets.

Property rights have been extended from physical things and businesses to abstractions through what are often known as intellectual property rights. The form of such property is usually trademarks, copyrights, or patents, but courts also recognize value in and rights to other abstractions such as reputations or brand images. The law concerning intellectual property rights varies greatly, and enforcement is erratic or nonexistent in some countries. Multinational corporations, many of which have vast interests in intellectual property rights, have had considerable success in embedding such rights in trade treaties, with the law in most countries conforming to those treaties. Enforcement, however, remains problematic. China, for example, is notorious for "pirated" copies of movies and music: "pirated," that is, from the perspective of the corporations that own the rights to the movies and music. The

problem with intellectual property is that traditional property rights such as exclusive use and control are very difficult to apply to entities which can be reproduced at zero marginal cost and the use of which by one person does not exclude the use by many others. Millions of people, for example, can listen to a Justin Bieber song at the same time without interfering with each other. Perfect digital copies of his songs can be made at no cost, and many people do not think there is anything wrong with violating copyright.

There are two key arguments in favor of intellectual property rights. The first is that people have an inherent moral right to their creations. The second is that the incentive of owning and benefiting from intellectual property encourages creativity. The argument against intellectual property rights is that it hinders progress by creating costs, including very high transaction costs, in what would otherwise be a zero-cost area. Imagine, for example, what a symphony performance would be like if every musical instrument in the orchestra had accumulated numerous patents and the score was under copyright. Patents and copyrights expire, but in the meantime, progress can be delayed. This is especially true if scientific and medical developments can be patented; it makes further progress that is dependent on the patented knowledge or techniques expensive or impossible.

## Theories of Property Rights

Numerous philosophical theories have been offered both in defense of property rights and in criticism. One of the most common justifications of property (including the private ownership of the means of production) is John Locke's. Locke argued that all people have a fundamental moral right to the product of their labors; a person who, for example, cleared land had a right to own that land, to exclude others from it, and to enjoy the produce of that land. Locke added the proviso that there had to be as much and as good left for others, but that proviso was suspended with the invention

of money since people without property could now make a living working for those who owned resources. Once original acquisition of property had occurred, ownership could legitimately be transferred by consensual agreement or inheritance.

The other most common justification of property rights is a utilitarian one. Private ownership is a major incentive for people to work, be creative, study, and so on. Overall, it is argued, societies that allow the private ownership of the means of production (or at least most of it) tend to be much richer than societies that do not. There are also more detailed utilitarian arguments, such as Hayek's claim that the right to consensual exchanges of property allows the development of market pricing, which supplies vital information about people's needs not available in non-market economies (Hayek 1944).

Various libertarians use either or both of the Lockean and utilitarian justifications of property rights.

The most sustained critique of private property rights was that of Karl Marx (Marx and Engels 1959), but even he thought that the private ownership of the means of production was a necessary stage in human progress. His criticisms included the claim that original acquisition had been a brutal process of dispossession, that laborers were now alienated from what they produced, and that private ownership of resources led to exploitation of those without property.

Proudhon famously argued that "All property is theft" (Proudhon 1966 [1840]).

The nature of the rights conferred by ownership has also been questioned. For example, some North American aboriginal cultures view ownership of land and natural resources as imposing on the owner a duty of stewardship, not just the right to exploit for profit. The Catholic Church, although clear that it considers private property morally legitimate, also thinks that ownership imposes stewardship responsibilities on owners, especially owners of land and natural resources; Psalm 24 and other passages of the Bible are cited to support this view (Francis 2015).

## The Distribution of Property Rights

If we consider the ownership of the means of production (businesses, land, natural resources, and intellectual property) and set aside personal property for a moment, then one of the obvious features of property rights is that they are stunningly unequally distributed. Most people don't own nonpersonal private property; most of those that do are people with some savings for retirement. The vast majority of private property is owned by a tiny segment of society in the order of 1% or less, though the exact distribution varies from country to country. Property rights are mostly rights held by a small class of people. Some people think this is unjust or creates social problems; others think it is acceptable or even desirable.

A common moral objection to highly unequal distribution of property rights is that inequality is simply unfair; the pie ought to be divided equally. In response, defenders of inequality claim that this sentiment is not a fundamental moral principle but just the emotion of mere envy. A more serious objection is that economic inequality causes serious social harm, including increases in drug use, incarceration rates, infant mortality, mental illness, obesity, teenage birth rate, violent crime, and so on (see Wilkinson and Pickett 2010 for an overview of the data). Both the accuracy and significance of these data have been questioned. However, even if the data on the social harm of inequality are accepted, there is the issue of whether utilitarian considerations like harm should overrule rights such as property rights. Diminishing economic inequality would seem to involve redistribution of the wealth, which would necessarily involve taxing or confiscating the wealth of the rich in violation of their property rights. On the other hand, governments might change the mechanisms of distribution and thus change the distribution of the wealth to the rich before they obtain a property rights claim. For example, changing the right of corporations to merge with or buy other corporations (which would be a change of legal property rights, not moral property rights) would significantly change

the distribution of wealth without redistribution of existing property claims.

## Summary

The laws of the relevant jurisdiction determine what rights are conferred by property ownership. Property can be owned by individuals or by legal entities such as corporations and government departments. Some things cannot be owned in most jurisdictions, such as people or some kinds of guns. People and legal entities in many countries can own land, resources, businesses, financial instruments, and intellectual property. The most common justifications of property rights are Locke's and utilitarian theory. Critics of private property include Marx and Proudhon. Many aboriginal societies and the Catholic Church think that property ownership involves stewardship responsibilities. The distribution of property ownership, and hence of property rights, is a contentious issue.

## Protestant Work Ethic

Ariane Hanemaayer

Department of Sociology, Brandon University,  
Brandon, MB, Canada

### Definition

The protestant work ethic was defined and explained by Max Weber (1864–1920), a German sociologist. In Weber's early writings, *The Protestant Ethic and the Spirit of Capitalism* (PESC), he characterized the protestant work ethic as an inner sense that you ought to work in a particular profession for its own sake, not just for financial remuneration. In PESC, Weber sought to explain the emergence of capitalism as a result of specific moral and religious beliefs that emerged after the protestant reformation. His aim was to explain how changes in cultural beliefs led to changes in individual behavior, which eventually brought about social and political change at the level of the structural organization of society. In order to support his argument, Weber reviewed protestant doctrines, such as the works of Martin Luther (1483–1546). Luther was a German monk who disagreed with church authority, and in his 95 *Theses*, he declared an end to monasticism and other regulations that the church had on everyday life. In reviewing historical texts, Weber found that the notion of a "calling," which had been previously reserved in Catholic writings for the kind of inner sense that one was *called* by God to monastic life (e.g., joining the priesthood), came to be applied to one's professional life: "The concept of the calling is a product of the Reformation. ... Precisely this new notion of the moral worth of devoting oneself to a calling was

the unavoidable result of the idea of attaching religious significance to daily work" (Weber 2002: 39–40). From the German "rufen," meaning "to call," "beruf" meant working in both a vocation and a profession. Weber concluded that this appropriation of religious ideas to daily life came to replace church activity as the place to show one's devotion to God: Luther suggested that working in one's professional vocation was a way to generate community as it allows individuals to work together in "brotherly" labor (Weber 2002: 40). Fulfilling your professional duties, in other words, was the "only way to please God," and this fulfillment was "God's will" (Weber 2002: 41).

The notion of the calling had implications for a protestant style of life. An ethic is understood as a set of beliefs, values, and worldviews that form a coherent whole and are guiding principles for action in one's *lifestyle*. The protestant ethic was not a form of morality, stipulating what kinds of work were "good" or "bad," but it did lay out how a protestant "ought to live." This ethic was embodied through personal choices and motivations to work in one's vocation as a meaningful way to conduct one's life.

Weber argued that this set of practices came to *rationalize* professional work in modern society. For Weber, rationality here entails two different levels of analysis. First, at the individual level, rationality is one's reasons for doing things: what motivated individual choices? The protestant ethic was a belief, a reason for taking up a profession as a value in and of itself and a motivation to work in that profession. The second level concerns the institutionalization of a mindset that would later dominate the organization of professional work. Because protestant beliefs rejected the "magic" of the Catholic Church's ad hoc absolution of sin through indulgence, this meant that protestants had to structure their entire lives around Godly and ethical behavior. Only living this systematic lifestyle could reassure protestant believers that they would be saved beyond this world. It is through this rationalizing process that this ethic became systematized. Rationality in this sense means that individual actions come to be

guided by abstract, universal principles that regulate behavior. Life could become predictable, calculable, and subject to various measures of control.

Weber's argument that the protestant work ethic created the conditions for the emergence of capitalism hinges on the notion that this ethic of working hard and efficiently in one's profession ensured the success of protestant businesses. Working hard was a sign of God's favor in this life, and the protestant work ethic came to dominate the business world. Weber used a metaphor of the "steel hard-casing" to signify the rigid structures that trap us today in a system of rationalized work environments. The protestant work ethic originated in a set of chosen practices based on what one group believed, but this has now become an inescapable situation for anyone in today's society: "The Puritan *wanted* to be a person with a vocational calling: today we *are forced* to be" (Weber 2002: 123). Today there is no work ethic needed; workers *must* work hard and efficiently in their professions: "The idea of an 'obligation to search for and then accept a vocational calling' now wanders around in or lives as the ghost of beliefs no longer anchored in the substance of religion" (Weber 2002: 124).

One example of this sort of economic coercion, as Weber refers to it (2002: 124), is observed in the rationalized organization of professional work. Weber thought of *bureaucracy* as a heuristic for understanding the ideal type of rationalized work. Bureaucracy is the body of professional administrators, selected on the basis of merit and qualifications, which is organized rationally with assigned specialists assigned to tasks in particular areas. There are six characteristic of modern bureaucracy: fixed jurisdictional areas and authorities; a hierarchy of command with super- and subordinate offices; a reliance on paper documents and permanent files; specialization of task along with specialized training; the full working capacity of the person in office; and the use of general rules for decision-making (Weber 1978: 956–958). In a bureaucracy, office holding is a vocation as it requires the individual to uphold the duties of the office for an "impersonal and

functional purpose" (Weber 1978: 959). Officials usually undergo specific training, are expected to work in their positions for a long time, and the office stipulates certain duties and responsibilities that are not necessarily tied to an exchange of services for remuneration.

More recently, sociologist George Ritzer (1993) has revised Weber's arguments about the force of rationalization on professional life. He identified five characteristics of what he referred to as the "McDonaldization" of work: efficiency, calculability, predictability, control through non-human technology, and the irrationality of rationality. In these work environments, tasks are rationalized to use the optimal means to achieve the desired outcome. This process often involves the use of nonhuman technology, which also plays a role in determining what tasks workers perform in addition to monitoring and calculating the outputs. Control plays a major role in these environments, as everything *from* the scripts the employees are supposed to follow to relate to customers *to* routine work and tasks aims to create predictable experiences that also keep the costs low. Occasionally these systems also produce unintended or "irrational" consequences. For example, the fast-food chain McDonald's is designed to produce the same product across the world, but this has led to a public health dilemma of obesity in many of the nations where the chain operates.

Some of the consequences of this type of rationalization have been analyzed in social science literature. Bureaucracies rely on the use of general rules to assess particular cases. Weber later substantiated this claim through an analysis of the legal profession. The law is based upon a principle of "generalization," meaning that general laws can be applied to adjudicate an individual case. For bureaucratic professional work, rules become tyrannical in the sense that they must be followed for the proper execution of one's official duties, leaving little room to question the outcomes of the rules or the reasons for their creation in the first place. Bureaucratic officials often cannot reflect upon the rules that guide their professional activity, and the consequences of those rules are not

taken into consideration: “In contrast to the “notable” performing administrative tasks as a honorific duty or as a subsidiary occupation (a vocation), the professional bureaucrat is chained to his activity in his entire economic and ideological existence. In the great majority of cases he is only a small cog in a ceaselessly moving mechanism which prescribes to him an essentially fixed route of march. The official is entrusted with specialized tasks, and normally the mechanism cannot be put into motion or arrested by him, but only from the very top. The individual bureaucrat is, above all, forged to the common interest of all the functionaries in the perpetuation of the apparatus and the persistence of its rationally organized domination” (Weber 1978: 988).

This form of bureaucratic organization can produce ethical conflicts for professionals and administrators alike. According to political theorist, Hannah Arendt, “As we know from the most social forms of government, that is, from bureaucracy . . . the rule by nobody is not necessarily no-rule; it may indeed, under certain circumstances, even turn out to be one of its cruellest and most tyrannical versions” (1958: 40). The results of the rationalization of the protestant work ethic have been considered as both dehumanizing and alienating. Dehumanizing because it removes the opportunity for bureaucratic decision-makers to think about the outcomes or consequences of the rules they must follow. It is alienating because it separates individuals from their humanity, which is, at its essence, their ability to make decisions on the basis of their individual beliefs or ethical principles.

## Pseudo-transformational Leadership

Barbara Steinmann

Bielefeld University, Bielefeld, North Rhine-Westphalia, Germany

## Synonyms

Personalized charisma; Pseudo-charismatic leadership; Unauthentic transformational leadership; Unethical charismatic leadership; Unethical component of transformational leadership

## Definition

The construct of pseudo-transformational leadership refers to leaders who abuse their influence, inspiration, and appeal to manipulate their followers in order to maximize their own gains (Christie et al. 2011). Like authentic transformational leadership (Bass 1985), also pseudo-transformational leadership consists of four leadership behaviors, the four I's: idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration (Christie et al. 2011). Even though they draw on similar behaviors, pseudo-transformational leaders may be differentiated from authentic ones for lacking a moral foundation of legitimate values (Bass and Steidlmeier 1999). Pseudo-transformational leaders employ their highly inspirational leadership behaviors and idealized influence for the

pursuit of self-interests and for the attainment of personal goals. In so doing, they exploit, dominate, and control followers (Barling et al. 2008; House and Howell 1992). Quite contrary to authentic transformational leaders, pseudo-transformationals are reluctant to intellectually stimulate followers, show little consideration for them, and disregard their subordinates' personal needs and feelings (Christie et al. 2011).

As the leader's charisma accounts for a great deal of variance in transformational leadership (Bass and Stogdill 1990), the present contribution refers to theorizing and evidence on pseudo-transformational leadership (Bass and Steidlmeier 1999) as well as on the concept of personalized charisma (House and Howell 1992).

## Description

Transformational or charismatic leadership has originally been conceived of as ethical neutral (Barling et al. 2008; Howell and Avolio 1992). Conger and Kanungo (1988), though, already early reasoned that charismatic leaders may use their ability to influence and motivate others for the pursuit of self-serving interests and thus to exploit and deceive followers (Dasborough and Ashkanasy 2002). Accordingly, transformational leaders may deploy their appeal with followers either to aggrandize themselves or to contribute to the welfare of the collective. For transformational leadership to contribute to the welfare of the collective, it needs to rest upon some kind of moral foundation (Bass and Steidlmeier 1999). As such, it is the leader's intent and her or his moral, ethical, or philosophical background which differentiates authentic from pseudo-transformational leaders (Parry and Proctor-Thomson 2002). Pseudo-transformational leaders may not only use their vision, inspiration, and charisma to seduce followers to contribute to their own interests but also to work toward illegitimate goals (Parry and Proctor-Thomson 2002). As followers of transformational leaders seek to emulate their leaders and personally identify with them, an unquestionable willingness to obey these leaders results. It is this willingness

which allows pseudo-transformational leaders to use and exploit followers for their own goals (Conger 1990).

In the literature, different types of pseudo-transformational leaders have been distinguished. Price (2003) referred to a variety of leaders ranging from those who are concerned with purely self-serving goals and egoistic values to those who indeed have altruistic concerns, but who show behaviors deviating from these concerns (Price 2003). Pseudo-transformational leadership is viewed from different perspectives such as from a personality approach (e.g., House and Howell 1992), a behavioral approach (Barling et al. 2008; Christie et al. 2011), or an attributional approach (Dasborough and Ashkanasy 2002; Lin et al. 2017).

## The Personality Approach: Characteristics of Pseudo-transformational Leaders

Pseudo-transformational leaders center on their own gains and put their own needs first. Therefore, egoism – that is an exaggerated sense of self-importance, uniqueness, and greatness (House and Howell 1992) – is a predominant characteristic of such leaders (Kanungo and Mendonca 1996). These leaders have also been suggested to score high on narcissism given that narcissistic leaders commonly use their charisma to manipulate and coerce followers (House and Howell 1992). Pseudo-transformationals are further distinguished by high levels of Machiavellianism (Dasborough and Ashkanasy 2002; House and Howell 1992), a tendency to maximize one's gains at the expense of others by deceiving and manipulating them (Christie and Geis 1970). Leaders with such a disposition are particularly talented in influencing others (Christie and Geis 1970). As Machiavellianism helps them to hide their true intentions, transformational leaders high in this personality trait may be perceived as authentic transformational leaders even if they pursue self-serving goals (Dasborough and Ashkanasy 2002). Like leaders high in Machiavellianism, also those high in emotional intelligence are better able to conceal their true intentions for having higher abilities in regulating their emotions (Dasborough and Ashkanasy

2002). Therefore, emotionally intelligent leaders also are more likely to be evaluated as authentic transformational leaders regardless of whether they pursue legitimate or manipulative intentions. Although they are characterized by an excessive sense of self-importance, pseudo-transformational leaders have yet been suggested to show an external locus of control and a low self-esteem (House and Howell 1992). People with an external locus of control believe that surrounding forces such as other persons, fate, or luck rather than their own characteristics and behaviors determine certain outcomes and occurrences in their lives (Rotter 1966). Low levels of self-esteem lead people to negatively evaluate their own competencies (Rosenberg 1965) and to doubt their ability to succeed (Campbell 1990). Together, these characteristics decrease the leaders' confidence in being able to effectively exert an influence on others. If leaders question their ability to arouse their followers' compliance, they likely draw on exploitative and coercive behaviors in leading (House and Howell 1992). As these influence tactics illustrate, pseudo-transformational leaders are controlling, assertive, and aggressive personalities distinguished by an uninhibited implicit need for power (House and Howell 1992). Not least, pseudo-transformational leaders are characterized by their low sense of responsibility (Bass and Steidlmeier 1999) which probably is a bounding condition for leaders to engage in unethical conduct.

### **The Behavioral Approach: Behaviors of Pseudo-transformational Leaders**

Pseudo-transformational leaders draw on the same behaviors in leading as authentic transformational leaders. Followers therefore rarely recognize their manipulation. Given that they pursue different ends, pseudo-transformational leaders yet exhibit behaviors which authentic leaders do not show (Christie et al. 2011). In order to increase their own gains and attain their goals, pseudo-transformational leaders control and manipulate followers at the expense of the organization's benefit (Howell and Avolio 1992). They disregard followers' rights and concerns (House and Howell

1992) and use their influence to keep followers subservient (Barling et al. 2008). One way of maintaining control over them is to undermine followers' self-confidence (Barling et al. 2008). Pseudo-transformational leaders do not tolerate followers' feedback or any debates and foster one-way communication (Howell and Avolio, 1992).

The behaviors pseudo-transformational leaders show may be subsumed according to the four I's which constitute transformational leadership: idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration (Christie et al. 2011). The way such leaders use the four I's, however, deviates from the way authentic transformational leaders employ these behaviors.

#### **Idealized Influence**

Transformational leaders articulate an attractive vision of a future goal state and provide a sense of mission to their followers (Bass 1985). That way, they stimulate followers to perform beyond expectations but also transform followers' values and align them to a shared mission (Bass 1985). Transformational leaders themselves act in accordance with the vision they draw and work toward its attainment. Therefore, they become role models followers admire and identify with. As followers further want to emulate their leaders, transformational leaders are able to ideally influence them.

Pseudo-transformational leaders are concerned with absolute power (Dasborough and Ashkanasy 2002) and success (Bass and Steidlmeier 1999). They therefore communicate a vision that contributes to their own self-interests and that is geared toward egoistic values (Howell and Avolio 1992) instead of highlighting higher-order goals aligned to the welfare of the collective. In fact, their vision often ignores the best of followers (Christie et al. 2011) even though these leaders pretend to use their power for the good of the organization (Bass and Steidlmeier 1999). Instead of turning into moral role models as authentic transformational leaders would do, pseudo-transformationals strive to become followers' personal idols (Bass and Steidlmeier 1999).

### Inspirational Motivation

Transformational leaders stand out by their ability to inspirationally motivate followers. By creating an appealing vision, they provide the work with meaning and challenge (Bass and Riggio 2006) and involve followers so that they also envision an attractive future goal state and work toward its attainment (Christie et al. 2011). As transformational leaders also demonstrate confidence in their followers' ability to attain the collective vision, they are able to motivate followers to achieve more than expected (Howell and Avolio 1992).

Inspirational motivation helps pseudo-transformational leaders to motivate subordinates to follow them and to contribute to the attainment of their self-serving vision. Just as their authentic counterparts, pseudo-transformational leaders are able to communicate a lively vision of an appealing goal state (Barling et al. 2008). They are rhetorically skilled, refer to images of uniqueness, and use a language full of metaphors in outlining their overall goals (Barling et al. 2008; Dasborough and Ashkanasy 2002). Thereby, pseudo-transformational leaders are able to manipulate their followers (Bass and Steidlmeier 1999). Furthermore, they articulate their vision in ways such that it appears more compelling and realistic as it actually is (Conger 1990). As such, they give false promises and deceive followers (Barling et al. 2008). Its liveliness and appeal, however, drive followers to align to this vision (Barling et al. 2008). Although pseudo-transformational leaders verbally seem to offer empowerment, they try to establish and maintain their followers' dependence (Bass and Steidlmeier 1999). Their extraordinary inspirational talent and their appeal help pseudo-transformational leaders to motivate followers to maximize the leaders' personal gains (Christie et al. 2011).

### Intellectual Stimulation

Transformational leaders stimulate their followers' innovativeness and creativity. They encourage followers to approach old problems in new ways and reframe them, to question the status quo and challenge current assumptions, to find

new or creative solutions, and to think critically (Bass and Riggio 2006; Christie et al. 2011).

Pseudo-transformational leaders refrain from such intellectual stimulation in order to keep control over their followers. Followers who think for themselves pose a danger for the leaders' agenda (Barling et al. 2008) as their thoughts and ideas may interfere with the leaders' self-interests (Christie et al. 2011). Therefore, pseudo-transformational leaders restrain information and resources (Barling et al. 2008; Bass and Steidlmeier 1999); censure critical, doubting, or opposing views and perspectives (Howell and Avolio 1992); and discourage followers from debating their vision (Christie et al. 2011). By spreading uncertainty, they prevent followers from challenging their opinion and make sure that their decisions are accepted (Howell and Avolio 1992). They do not tolerate followers' input (Barling et al. 2008), but yet take credit for others' ideas if these ideas are recognized (Bass and Steidlmeier 1999). If they for once refer to their followers' opinion, it is for impression management purposes (House and Howell 1992). Pseudo-transformational leaders do thus not only refrain from intellectually stimulating others but rather actively prevent followers' independent thoughts and try to suppress their intellectual abilities (Christie et al. 2011).

### Individualized Consideration

Not least, transformational leaders act as coaches or mentors and try to develop their followers by creating learning opportunities and delegating tasks. They frequently communicate with followers and encourage personal exchanges (Bass and Riggio 2006). Based on these interactions, transformational leaders are aware of their followers' individual needs, which they consider in leading.

Whereas authentic transformational leaders are characterized by their concern and respect for followers, pseudo-transformational leaders do neither care about their subordinates' individual needs for self-actualization and development (Howell and Avolio 1992) nor about their dignity (Bass and Steidlmeier 1999). Rather, they exploit their followers' feelings to keep them distant and

dependent (Bass and Steidlmeier 1999). They are lacking consideration toward their followers (Bass and Steidlmeier 1999) and value them just for the contribution they make to progressing toward their own personal goals (Christie et al. 2011).

In sum, pseudo-transformational leaders use these behaviors to arouse followers' unconditional loyalty and to exploit them for their own aggrandizement. In that, inspirational motivation (high) and idealized influence (low) have variously been ascribed a dominant role (Barling et al. 2008). But also the leaders' orientation toward self-serving values and their active attempt to suppress followers' independent thought and taking on of new perspectives have been highlighted in this regard (Christie et al. 2011).

### **The Attributional Approach: The Ascription of Pseudo-transformational Leadership**

The attributional approach posits that the ascription of pseudo-transformational leadership results from the interaction between leaders and followers and substantively depends on the way followers perceive and evaluate their leaders' intentions (Dasborough and Ashkanasy 2002). As authentic and pseudo-transformational leaders draw on the same sets of behaviors in leading, the leader's intentions are vital in distinguishing them. If followers perceive their leaders to have self-serving, manipulative intentions, they are more likely to describe their behaviors as pseudo-transformational (Dasborough and Ashkanasy 2002; Lin et al. 2017). Apart from the leaders' characteristics and behaviors (see the sections on the personality and behavioral approach to pseudo-transformational leadership), Dasborough and Ashkanasy (2002) emphasize characteristics on the part of followers that are related to the attribution of manipulative intent. As such, followers have been assumed to more likely ascribe their leaders manipulative and self-serving intentions, and thus pseudo-transformational leadership behaviors, if they are in a negative compared to a positive mood as such a mood negatively biases thought processes like the evaluation of one's leader. Moreover, higher ascriptions of pseudo-transformational leadership

behaviors result if followers observe the leader's behavior instead of being its target. Under this condition, they are emotionally less involved and thus more critical about the leader's intentions. Not least, if followers have a higher work experience, they are less naïve and less susceptible to the leader's impression management yielding higher attributions of self-serving or manipulative intentions. Besides these behaviors and characteristics on the part of followers, the attributional approach assumes prior interactions between leaders and followers to affect followers' perception of pseudo-transformational leadership. Accordingly, followers are more likely to label their leaders' behaviors as pseudo-transformational, if prior interactions have led to negative feelings toward the leader, if leaders show inconsistent and non-consensual behavior or behavior that deviates from situational norms, or if a leader's actions entail negative consequences for that follower or result in a negative emotional response (Dasborough and Ashkanasy 2002). How accurate these ascriptions actually are seems to depend on the followers' emotional intelligence: The more emotionally intelligent the followers, the better able they are to accurately perceive and interpret emotional cues (Dasborough and Ashkanasy 2002).

### **Outcomes of Pseudo-transformational Leadership**

Pseudo-transformational leaders articulate an appealing vision of a better future state. Followers are therefore initially attracted to such leaders (Barling et al. 2008). As soon as they become aware of the leaders' selfish and antisocial motives, though, followers' devotion decreases, and the admiration of immediate followers turns into fear and suspicion (House and Howell 1992). Remote followers, by contrast, stay committed to these leaders and their vision over a longer period of time for having less direct contact with them (House and Howell 1992). In order to not endanger their self-interested agendas, pseudo-transformational leaders suppress their followers' development and taking on of new perspectives (Barling et al. 2008). As a consequence, followers become obedient, compliant, and dependent

(Howell and Avolio 1992) and show unconditional loyalty to their leaders (Lin et al. 2017). Barling and colleagues (2008) reasoned that the followers' dependence may be transmitted by the personalized identification followers develop due to the leaders' abilities to ideally influence and inspire these followers. Idealizing their leaders, followers tend to ignore the negative aspects of pseudo-transformational leadership (Conger 1990). Just like those of authentic transformational leaders, also followers of pseudo-transformational leaders emulate their leaders' behavior. As these leaders act self-servingly, followers engage in less contextual performance directed at the good of the organization (Lin et al. 2017). Research found this effect to be transmitted by lower levels of organizational identification (Lin et al. 2017). Besides its detrimental impact on extra-role performance, pseudo-transformational leadership has also been found to undermine followers' in-role performance (Schuh et al. 2013). Lending support to the assumption that pseudo-transformational leaders suppress followers' independent and creative thinking results of an experiment revealed that this leadership style indeed led to significantly less idea generation than authentic transformational leadership (Christie et al. 2011). Empirical evidence further revealed pseudo-transformational leadership to positively relate to followers' fear of leaders' exploitative and assertive behavior, their perceptions of job insecurity and abusive supervision, as well as to followers' obedience and dependence (Barling et al. 2008; Christie et al. 2011).

## In Conclusion

Drawing on the same kinds of behaviors, followers may not easily distinguish authentic from pseudo-transformational leaders (Dasborough and Ashkanasy 2002). Whereas the means they employ are similar, the intentions they have and the goals they pursue differentiate these leaders. Based on their ability to articulate an attractive vision and inspire them, followers are initially as attracted to pseudo- as to authentic

transformational leaders. Those working under leaders to whom they ascribe manipulative and self-serving intentions, however, soon become disenchanted with their leaders (House and Howell 1992). As these leaders are able to motivate followers at the expense of the collective while keeping them dependent, pseudo-transformational leaders are threatening the performance and welfare of followers and entire organizations (Christie et al. 2011; House and Howell 1992).

## Public Goods

Rakesh C. Gupta  
Willumstad School of Business, Adelphi  
University, Garden City, NY, USA

### Synonyms

Collective consumption goods; Government products and services; Public sector goods; Social goods

### Introduction

In current economic thought public goods are those that have the following two characteristics:

Non-rivalrous – a good that once produced can be consumed by anyone and still is available for consumption by others [without diminishment].

Non-excludable – there is no reasonable way to prevent anyone from consuming it, whether they have contributed to its production or not.

### Historical Context

“Public goods” have been an important part of the social fabric since humans, as social animals, began to form collectives, groups, and communities in the Paleolithic era, about 75,000 years ago. Through the ages these collectives have grown in size and complexity to the point where we now have seven billion people on the planet organized in myriad formal and informal groupings.

One common element of any societal group is the give-and-take between and among groups and

their members. As a privilege of being a member of a group, each person is supposed to contribute something to the welfare of the group. The pooled resources of the group are supposed to be used for a variety of activities that safeguard, sustain, and grow the group.

Enlightenment philosophers such as Hobbes, Locke, Rousseau, and others opined on the role of government and the governed. Dougherty (2003) neatly encapsulates the differing views of public goods by various more recent thinkers such as Hamilton, Madison, Mill, and others. But Adam Smith (2014 [1776]) was perhaps the first to address the topic in explicitly economic terms. And, it was Paul Samuelson (1954) who gave public goods a mathematical economic definition that pervades current economic literature.

## Social Issues

There is a widespread belief, though unfounded, that public goods are to be provided solely by the government (Holcombe 1997; Anomaly 2015). The argument rests on the fact that in a free market economic system, private enterprise will not be able to charge a reasonable price to make a profit if anyone can use the goods once they are made available.

Regardless of who provides the public goods, there are two other related issues: how much to charge for the good, and how to deal with “free riders.” If a community park is built by contributions from local residents but is open to the general public, then there may be “outsiders” who get the benefit of the park without having contributed. Of course, mechanisms can be devised to exclude non-contributors, but that would only increase the costs to the community!

## Examples of Public Goods

Most commonly cited examples of public goods are national defense, law enforcement, and public education. Other items that may be classified as public goods: public infrastructure such as non-

toll roads and bridges, unpatented inventions, government reports and statistics, over-the-air radio and TV, clean air and water, the internet, many websites, the Gutenberg Project, etc (The Linux Information Project 2006).

## Changing Nature of Public Goods

The twentieth century saw rapidly increasing globalization and massive diffusion of technology. Both of these forces together and separately have created transnational impacts on environmental quality, climate change, global security, trade, employment, health, and migration, to name just a few areas, necessitating the concept of global public goods. Though these global goods are non-rivalrous and non-excludable, their management is more complicated because of the sheer scope and size of the actors involved—governments, multinational corporations, nongovernmental organizations, supranational organizations, etc. (Kaul et al. 1999).

## Publication Ethics

Virginia Barbour  
Office of Research Ethics and Integrity and  
Library, Queensland University of Technology  
(QUT), Brisbane, Australia

## Introduction

Publication ethics encompasses the principles, policies, and practices that exist to ensure that published work can be trusted as a reliable source of evidence. Primarily, this discipline is applied to academic work, where it is of most importance, though it is of relevance to anything that is published. For the vast majority of academic disciplines, academics are judged on what they publish, whether within journal articles, books, or monographs. An industry has grown up, most notably since the middle of the last century, to support this publishing need. The academic publishing industry is dominated by a small number of large commercial publishers, but also includes publishers from universities and academic-led journals. Most publishing is supported by subscriptions, although open access, funded in other ways, is increasing in importance.

Publication ethics is best developed in relation to journals. Ethical issues may arise at any stage of the publication lifecycle and may involve anyone who undertakes any of the activities of publishing, from author to publisher.

Articles are written by authors, submitted to a journal, undergo a basic quality control check by

journal staff, and are then sent to journal editors. Editors make initial decisions on appropriateness for the journal and if that stage is passed will send papers for in-depth review by expert peer reviewers. After reviews, editors then decide on publication or not. Final responsibility for publishing usually rests with an Editor-in-Chief. Editorial responsibilities are distinct from those of a publisher, who is responsible for the financial and business aspects of the journal. Usually editorial and publisher roles are performed by different individuals.

The reputation of published research as a reliable source of information for other academics, policymakers, and the wider public relies on the integrity of the publication process; policies and practices associated with publication ethics, therefore, have an important role to play in supporting this integrity. Publication ethics issues should not be considered in isolation from research ethics, though in practice matters are handled as publication ethics either when they occur specifically during the publication process, or are identified during or after that process. Furthermore, there is increasing acceptance that even issues that appear to lie purely in the ambit of publication ethics (e.g., plagiarism) will have their origin at some other time of the academic lifecycle, or may be influenced by or related to other academic activities. On investigation, there will generally be other factors contributing to the ethical breach, which may include undue pressure to publish, lack of awareness or training in appropriate practices, or different cultural norms.

Hence, when an issue arises, it is often necessary to investigate and take action both at the level of the journal and the institution where the relevant individual is employed or enrolled as a student.

A taxonomy of publication ethics issues has been developed by the Committee on Publication Ethics (COPE) and definitions used here are taken from that taxonomy (COPE 2013). Some of these issues are inherent to a particular role in the process, such as plagiarism. Others, such as conflicts of interest, may occur at a number of stages in the process or come from a variety of participants.

---

The author, Virginia Barbour, was the Chair of COPE from 2012–2017.

## Authors

### Plagiarism

Plagiarism is defined “as taking, using or presenting others’ ideas, data or results, writings and inventions without giving due or appropriate credit to the originator” (COPE 2013). Plagiarism is not new. However, use of online writing tools has greatly accelerated the ease by which large amounts of text can be copied, and even subtly changed (in an attempt to avoid detection), and then inserted into academic work. Plagiarism can be detected by online programs and these are routinely employed by both academic institutions and journals.

### Fabrication and Falsification of Research

Fabrication or falsification of research findings may often come to light during the review process. Indications of fabrication or falsification may be obviously manipulated figures, or data that is “too good to be true.” Fabrication or falsification may also only come to light after publication, often following online scrutiny, or following action by whistleblowers.

### Authorship

Authorship issues are very common. Issues include authorship disputes (over author order, or who should not be an author); the addition of guest authors (authors added solely in an attempt to increase the chance of acceptance by a journal); gift authors (authors added as a favor to a colleague), and ghost authors (authors who are left off an authorship list in order to hide their conflict of interests).

## Reviewers

Reviewers are selected for their expertise by journal editors to assess submitted work in a timely and impartial manner. Examples of ethical breaches by reviewers include not declaring an association with the author of a manuscript and then providing a biased review; holding up a review process unduly in order to gain an advantage over authors they regard as competitors

or against whom they have a bias; appropriating authors’ work; and attempting to publish it themselves.

## Editors

Editors are expected to be impartial in their handling of publications and to declare any relevant conflicts of interest, and recuse themselves from handling papers as appropriate. Editorial ethical breaches include publishing their own, their colleagues’, or even their relatives’ work without having in place a process to ensure that no undue favor occurs; failing to provide an appropriate review or editorial process; failing to have a mechanism in place to correct papers post publication; failing to manage conflicts of interest.

## Journals and Publishers

Journals and publishers may also be unethical in their overall functioning. Examples of such ethical breaches include journals that have been set up to favor the publishing of research from specific organizations such as pharmaceutical companies; journals or publishers who misrepresent the services they provide to authors, such as claiming to have an independent peer review process, when they do not; or taking money for publication under false pretenses. These latter journals or publishers are often called “predatory.” Journals may also be affected by conflicts that arise in the publishing of papers such as clinical trials, for which sponsoring companies may be willing to pay large sums for reprints of papers that favor their product.

## Issues Not Limited to One Group

### Conflict of Interest

Conflicts of interest (COI), also sometimes called competing interests, can occur at any point of the publishing or research lifecycle. They may be defined as “the existence of factors, situations or relationships that might inappropriately influence (bias), positively or negatively, a person’s

actions.” (COPE 2013) They are often underestimated as a cause of problems, especially non-financial COIs such as personal or professional relationships, which may be very common in academia. There is an increasing expectation that journals will have processes in place to identify and manage COIs from authors, reviewers, and editors. Processes may include refusing to publish papers where a COI is deemed to exist; excluding reviewers or editors from handling papers where they have a COI; and having a clear declaration of relevant COIs on a published work. Standard COI forms exist, such as that developed by the International Committee of Medical Journal Editors.

## Strategies for Addressing Publication Ethics

### Screening

Some types of publication ethics issues can be screened for; the most well-developed example of this is screening for plagiarism. At journals, this may be done at the time of initial submission, during the review process, or at any point up to the time of acceptance. The process for plagiarism screening involves processing text through a program that scans for similarities for text contained within online databases of journals, books, theses, and other published work. The software produces a numerical similarity score and a visual comparison of the similarities. Although useful and important as a screening tool, these programs require human scrutiny to determine the relevance of the result and action required.

Manipulation of figures within papers can be assessed by scrutinizing figures in standard software programs, e.g., by changing the contrast setting of the program and viewing the figure to determine whether there are any obvious inconsistencies. Screening for figure manipulation is not ubiquitous but practices in this area have been developed by the *Journal of Cell Biology* and many other journals have now instituted similar processes.

A sophisticated type of screening involves the use of statistical programs to examine datasets to look for unusual patterns in the data. This type of

screening can determine inconsistencies such as whether data have been fabricated. This type of screening requires specific programs and a high level of expertise to interpret the results. It is likely to become more important as papers that analyze large datasets become more common.

## Management of Publication Ethics

Publication ethics are connected to the wider issue of research ethics and any given issue may be symptomatic of a broader issue at the level of the individual, their institution, or more globally a culture in which there is an expectation of academics that they need to publish regularly to advance in their career – the “publish or perish culture.” Ethical issues occur on a spectrum. At one end are poor research practices such as a failure to record work properly or store data generated in a systematic secure way which leads to unreliable published work. At the other extreme is fabrication of research results and performing unethical work such as unapproved experimentation on humans or animals. What brings all these issues into the realm of publication ethics is that the issues may be first identified at the time of publishing or, following publication, in the published work. However, even if an issue is identified and investigation is undertaken initially by a journal, there may often need to be a further referral to the relevant institution.

In any issue of publication ethics, there are, therefore, two distinct issues to be addressed. The first is correction of the published work, to ensure that there is a current version that reflects any changes. Management of this process is primarily the responsibility of the journal and its publisher. The second is the investigation of the circumstances under which the issue arose.

### Processes for Correcting Published Work

Journals must have mechanisms in place to correct the record when publication ethics issues are identified post publication, or even if “honest” errors have been identified that undermine the integrity of the published work. With the advent of online publishing, it might be expected that

issuing corrections would be simple; however, there is still no general agreement for how to handle changes to papers post publication. Furthermore, because published articles may appear in many different places, online as well as in print, it is not possible to remove or correct them everywhere. Managing versions of such articles is challenging and relies heavily on accurate identification of articles through permanent identifiers such as Digital Object Identifiers (DOIs).

For simple issues, journals usually issue a correction notice that is linked to the original article at the primary place of publication, and which explains the correction. The original article will not be changed. Online tools can alert readers to changes post publication. The most important mechanism is through the CrossMark scheme run by CrossRef which certifies both the definitive published version of record and whether any changes are associated with that version. For more serious issues, such as where a whole article is deemed to be unreliable, the journal may retract the paper, which is a way of indicating that the journal and/or its authors no longer stand by the published article. The journal will issue a retraction notice, which is displayed and linked in the same way as a correction notice. However, the article itself will usually not actually be removed from the journal. Some journals are experimenting with new models, such as “retract and replace” whereby an original article is retracted and replaced with a new version. This mechanism is used where the cause of the retraction has been identified as being due to honest error, not misconduct.

### Investigation of Publication Ethics Issues

Investigation of any underlying issues and the application of sanctions to the individual(s) responsible is the responsibility of the university or other relevant institution with which the individual is associated and may be subject to national guidelines such as in the United States, Canada, or Australia. It is increasingly common for universities to have offices that are responsible for handling allegations in relation to breaches of publication or research ethics. Universities may specify training in research and publication ethics

that academics or students need to undertake in order for them to be employed or enrolled at that institution.

### Setting the Culture for Publication Ethics

There is also an important role for universities, funders, scholarly societies, and other professional organizations in defining expectations and norms for publication and research ethics. In the United Kingdom, a national survey in 2014 (Nuffield 2014) found the publish or perish culture was leading many academics to consider how cut corners in order to maximize their chances of publication. A systematic review found that around 33% of research scientists admitted themselves to some form of questionable research or publication practices and 72% believed their colleagues had been responsible for such practices (Fanelli 2009). Increasingly, expectations of best practice are being made explicit through national and institutional policy statements. Funders have a unique role in setting expectations of the researchers they fund and may, as a result of this funding, or the threat of its withdrawal, be able to mandate specific requirements, e.g., on the investigation of issues that arise in published work.

Several professional bodies contribute to the development of norms in publication ethics. The largest of these is COPE, an international membership organization of journals and publishers set up in 1997. COPE publishes guidelines for editors and publishers on how to triage and manage publication ethics issues. Other professional bodies who provide relevant advice are the Council of Science Editors, World Association of Medical Editors, and International Committee of Medical Journal Editors. Publication ethics is also discussed at global conferences including the World Congress on Research Integrity, the Peer Review Congress, and the meetings of the Council of Science Editors. Specific scholarly societies also have their own guidelines and conferences which are especially important as they ensure that general ethical principles are made relevant to specific disciplines.

Journalists have also had an important role in the scrutiny and commentary on publication ethics issues. The most well-known of these sites

is Retraction Watch. Publication of stories in the mainstream media has brought publication ethics issues to the attention of global audiences.

## **Evolving Issues in Publication Ethics**

### **Publication of Clinical Trials**

Clinical trials are an important type of evidence for the assessment of new treatments, and publication of trial results can affect the profits of companies whose products are being tested, which leads to inherent conflicts of interest in the publishing of these papers. Trials are often run by the companies who have a stake in the results and the same companies may also be heavily involved in the write up of these trials, either directly or via third-party companies. As a result, negative trials may be suppressed, positive results overestimated, or trial reports biased. In order to address these biases, trial registries were set up which specify a minimum requirement for reporting and in 2005 the International Committee of Medical Editors indicated they would not accept for publication papers that had not been registered at the inception of the trial. Industry professionals have also set out guidelines for responsible reporting of clinical trials and other industry research.

### **New Models of Publishing and Peer Review Post Publication**

Publishing is in the midst of a period of disruption as a result of new technologies that are available for the dissemination of results. The easy availability of tools to cut and paste text and images has probably led to image manipulation and plagiarism becoming more prevalent. Another reason for the increasing identification of these issues may be that more research (if not most) is now available online and an increasing proportion is free to read, which has led to increased scrutiny of published work. There are now several online forums where challenges to and comments on published work are made public (“post-publication peer review”) allowing a culture of increased scrutiny of published work. Comment and intense scrutiny on social media is also very

common, especially for high profile work and may lead to refutation of findings, as was the case for a paper that claimed to have identified arsenic as a possible chemical basis for extraterrestrial life.

Other innovations are emerging such as pre-print publishing (work posted online before formal publication) and novel models of peer review. As publishing evolves, so will the ethical challenges facing it.

### **Increasing Global Participation**

In the past decade, emerging economies such as China have been responsible for an increasing number of publications. The volume and type of publications have produced new challenges for journals. One of the most notable has been outsourcing by authors of the submission and on occasion preparation of research articles to third-party companies. Although there is a legitimate role for companies to assist in the preparation of articles, especially for language editing where authors are not native English speakers, there have been instances of abuse of process, e.g., some companies who have attempted to subvert the peer review process by suggesting fake reviewers for papers, who then recommended acceptance. Because of lax processes in place at several journals, a number of these reviews were used unquestioningly and led to papers being erroneously accepted. After the issue came to light, many of these papers had been retracted. These cases highlighted fundamental flaws both in the production of research and its publication and the need for vigilance as publishing evolves.

### **Reproducibility and the Future of Publication Ethics**

There is a need to ensure that published work in many fields should be fully reproducible. This requirement goes beyond the expectation that published work is not fabricated or falsified, but takes a holistic approach to the integrity of academic work that begins when work is planned, and encompasses good management of data generated during research, sound research practices, and publication practices that not only ensure there are no ethical breaches but also includes

the full and transparent reporting of work as championed by the EQUATOR 2017 network, and the availability of data underlying published work. Publication ethics increasingly has to consider this wider landscape and will need to evolve in order to meet new challenges.

## Racial and Ethnic Diversity in Business

J. Angelo Corlett  
Philosophy & Ethics, San Diego State University,  
San Diego, CA, USA

### Synonyms

Affirmative action; American Indians; Diversity; Ethnic identity; Ethnicity; Public policy administration; Racism; Rectificatory diversity; Sexism; U.S. blacks

This entry discusses a core issue with regard to racial and ethnic diversity in the context of business with special attention to business enterprises in the United States of America. It assumes that certain policies such as affirmative action are morally justified, and sets out to address one particular concern about affirmative action policies as they currently function. In particular, it seeks to answer a particular concern about how members of targeted groups might be plausibly identified in order to reduce the risk of fraudulent or mistaken identification. A new understanding of diversity is provided, one which is backward-looking and forms the basis of a plausible approach to racial and ethnic diversity in business.

## Introduction

On the assumption that affirmative action<sup>1</sup> for the sake of racial and ethnic diversity is a morally legitimate core value of businesses throughout the United States of America and assuming also that US-based businesses ought to strive for racial and ethnic diversity, it is vital that there exist a plausible account of how to properly categorize persons into racial and/or ethnic groups for purposes of creating and sustaining racial and ethnic diversity in businesses.<sup>2</sup> As we shall see, there are confirmed attempts – and somewhat successful ones at that – of various people self-identifying as, say, a US black<sup>3</sup> or as an American Indian<sup>4</sup> whose evidence for such a claim is lacking, genealogically speaking. As a result, the core moral value of workplace diversity is undermined – even by many of those who speak both often and loudly in terms of said diversity. Perhaps even more importantly, valuable and scarce resources are squandered on either fraudulent or mistaken racial

<sup>1</sup>The issue of affirmative action is addressed in Boxill (1984); Corlett (2003, 2010); McGary (1999).

<sup>2</sup>The analysis of ethnicity for purposes of positive public policy administration is found in Corlett (2003: Chapters 1–3). This article is an attempt to apply that analysis to the particular context of business.

<sup>3</sup>By “U.S. black(s),” I mean those of sub-Saharan African genealogy whose ancestry also traces through the institution of race-based slavery in the U.S.

<sup>4</sup>By “American Indian(s),” I mean those peoples indigenous to the Americas, especially to North America.

or ethnic self-identifications which means that such resources are not reaching those who need it most and who genuinely qualify as, say, an American Indian or a US black. Assumed here is the truth of the claim that it is as important to accurately identify ourselves into racial or ethnic groups as it is to have diversity in business.

### The Problem of Racial and Ethnic Identity

One of the most controversial claims made by some in academia is the notion that self-identification is a sufficient condition of racial and ethnic identity. The position is not so sophisticated as to be phrased in such a manner, however. This view might be characterized by the claim that “I am what I say I am.” In other words, many believe that one is what one says one is insofar as one is sincere when one says what they are in either racial or ethnic terms. This is intended to constitute racial or ethnic self-identification, it is held. Indeed, this position is actually raised as an objection to the idea that when it comes to positive public policy administration (affirmative action), the most reliable (though not unproblematic) manner by which to determine ethnicity is genealogical. This concern is allayed, however, because it is argued that self-identification can be fraudulent or simply mistaken, as the case may be (Corlett 2003). Rather than rehearse the specifics of such concerns here, I shall instead point to two recently discussed cases in the popular news media.

During his 2016 US presidential campaign and since then, Donald Trump has often referred to Senator Elizabeth Warren as “Pocahontas” in reference to the famed American Indian woman who often stands as a symbol of American Indian pride. Trump, in referring to Warren in such a manner, is not intentionally denigrating American Indians or their rich and proud heritage. Rather, he is mocking Warren’s attempt to pose as an American Indian when in fact she is not an American Indian. It turns out that most who heard or read Trump’s words about Warren were unaware of Warren’s claims to American Indian heritage. Warren is from Oklahoma and claims to be of

Cherokee heritage, stating that it was family lore that led her to her conclusion about her supposed Cherokee status. She has claimed such heritage since she was young. Setting aside the fact that Trump’s mockery of Warren’s claim to Cherokee heritage constitutes an attempt on Trump’s part to deflect attention away from issues Warren and others raise about Trump and also does so in an *ad hominem* manner, it is important to consider the matter of racial or ethnic self-identification in order to weigh the philosophical and moral value of the somewhat popular idea among an increasing number of academics that self-identification is a sufficient condition of racial or ethnic identity, a view that finds much support in academic discussions of race and ethnicity. (Cf., for example, Alcoff 2006; DesAutels and Waugh 2001)

Again, the position in question can be stated tersely as “I am what I say I am” whenever I communicate sincerely about my own race or ethnicity. To be sure, there is only one human race, and so our primary consideration here ought to focus on the extent to which the self-identification theory of ethnicity holds water, or whether it crumbles under refined philosophical scrutiny.

Remaining with Warren as our example, it turns out that she has not yet produced credible evidence of her Cherokee or even (more broadly) American Indian ancestry, which seems to raise severe difficulties for her self-identification *in terms of positive public policy administration*. There is a lengthy history of many US whites self-identifying as American Indians in order to capitalize on some of the meager benefits that American Indians receive. It is a history of racist exploitation, whether or not it is intentional (Corlett 2003). Indeed, the Dawes List which includes those Cherokees who can be traced to the Cherokees of the “Long Walk,” the infamous “Trail of Tears,” does not include anyone in Warren’s family tree (<http://www.cnn.com/2016/06/29/politics/elizabeth-warren-native-american-pocahontas/>; <https://www.theatlantic.com/politics/archive/2012/05/is-elizabeth-warren-native-american-or-what/257415/>), and it would appear that if one is not listed on the official rolls of the American Indian nation to which one says she/he belongs, she/he had better be able to produce substantiated evidence that one belongs to said

group. Otherwise, one ought not to claim membership in said group as that would, for positive public policy purposes, be incorrect. Furthermore, if it is done without substantiated evidence and repeatedly and with intent, it constitutes fraud and perhaps even racist fraud.

It is clear that one has the right to claim whatever one desires to claim about himself or herself in the privacy of their own lives, quite aside from public policy considerations. One might claim to be a monkey, or a dog, or a cat, or a mouse, or even an automobile of some sort or another. But when it comes to public policy issues, self-identification can and does lead to serious fraudulent consequences even if constitutes an “innocent error.” It is plausible to think that had Warren not indicated on her application to Harvard University that she was an American Indian that she might well not have been admitted to Harvard University. Yet her not being admitted to Harvard University might well have had a significantly lesser impact on her ability to eventually become a US Senator, etc. So it is no wonder that many believe that Warren’s self-identification as an American Indian was as self-serving as it was fraudulent and even racist in that it exploited for her own career benefit the most oppressed and exploited peoples of the Americas and perhaps in world history. This is an illustration of why it is correct to expose the implausibility of the view that self-identification is a sufficient condition of racial or ethnic identity (Corlett 2003). It would appear to be false, then, to state that *for purposes of public policy administration*, “I am what I say I am,” either racially or ethnically speaking.

Another case of affirmative action fraud by a white woman for self-serving career purposes is that of the Rachel Dolezal. Dolezal, who headed the Spokane, Washington, chapter of the NAACP, recently changed her name to Nkechi Amare Diallo and has in at least one interview expressed contempt for those who challenge the ethics of her self-identification of US blackness. Photographs of her demonstrate that she grew up with morphologically white features and subsequently altered her morphological features by way of make-up, hair texture appearance, etc., to make herself appear to be black. Indeed, that her parents debunked her claim to blackness, saying

that Dolezal and they are white, leads many to question her motives for her continued self-identification. In any case, it is an illustration of business fraud in the form of self-identification of blackness by a nonblack person for personal career enhancement. Many US blacks consider her action to be a form of racism (<http://www.mercurynews.com/2017/03/02/rachel-dolezal-who-famously-impersonated-a-black-woman-takes-african-name/>: accessed on 23 March 2017; <https://www.yahoo.com/news/rachel-dolezal-struggles-racial-identity-scandal-071759431.html>: accessed on 25 March 2017) This is another instance wherein a white woman deliberately attempted to pass as being a member of another ethnic group in a fraudulent manner and for personal career gain.

If not for the increasing pervasiveness of the notion that “I am what I say I am,” especially among some leftists, such fraudulent behavior could not persist or succeed as often and as much as it does. Moreover, it is particularly problematic in the present context wherein self-identification is the sole means of racial and ethnic identification. And what is morally astounding is that Warren and Dolezal continue to insist that they are members of the ethnic groups to which they claimed memberships even though the problematic nature of their self-identifications has been exposed to the public. Perhaps they have convinced themselves so deeply and for so long a time that they are members of such groups that, coupled with the “I am is what I say I am” presumption, their resolve is strengthened to claim American Indian and US black heritage, respectively. But is it really true that *for purposes of positive public policy administration*, I am what I say I am? *For purposes of positive public policy administration*, are Warren and Dolezal really what they say they are, racially or ethnically speaking?

One of the deep flaws with the current system of affirmative action in business is that it fails to set a standard of ethnicity beyond that of simple self-identification. It is not just a matter of self-identification that is often prone to fraud and mistaken identity, but the system fails to provide some standard of the degree or amount of ethnicity one must satisfy in order to be properly classified as a member of this and that group. This is

because the system is confused about which general standard of ethnicity to adopt. Indeed, most people still believe in the theory of human races, a theory so primitive and yet so resilient – and yet so terribly philosophical problematic (Corlett 2003: Chapter 1). Moreover, the Human Genome Project has refuted the very idea that there is more than one human race. The fact is that there is only one human race, but several ethnicities. So it is really ethnicities which ought to be the issue here, and our membership in them. And with the outdated notion of purity of race or ethnicity set aside, it is really a matter of which ethnicities to which we belong and what evidence might be adduced to substantiate such claims to ethnic identification.

One suggestion is that public and business policy ought to follow the lead of American Indian nations in identifying persons ethnically speaking (Corlett 2003). It is not that such a view of how American Indian nations is somehow flawless, as it is morally arbitrary as to which percentage of, say, Chumash genealogy one must have to genuinely be considered a Chumash Indian. Yet if the US Government continues to allow American Indian nations to decide for themselves which percentage of genealogy one must have to be considered a member of their respective groups, then this at least preserves the sovereignty of such groups in some meaningful measure. Given the bleak history of American Indians since the European invasion of the Americas, this is a good thing in order to respect American Indian sovereignty and autonomy.

Generally speaking, *one ought to for positive purposes of public policy administration select that ethnic group to which one belongs predominantly, genealogically speaking* (Corlett 2003, 2010). This approach to ethnic identity has the benefit of not being abused as in the cases of Warren and Dolezal, among many others. But it must also comport with the standard that there is a minimal genealogical percentage one must satisfy to be a meaningful member of a particular group, *for purposes of public policy administration*. This genealogical analysis of ethnicity requires that there be solid genealogical evidence (DNA, for example, or historical documents, etc.) that would

confirm to a reasonable person weighing such evidence that X belongs to a certain ethnic group, predominantly. By “predominantly” is mean that a person belongs to a particular ethnic group as much or more than any other ethnic group to which she belongs. This view rules out self-identification as being either a necessary or sufficient condition of ethnic identity, and for the same reason, because self-identification of ethnicity can be the result of self-deception, fraud, etc.

While accurate ethnic identification is important in business for the sake of diversity, it is also vital to understand what diversity is and why diversity is crucial in business. There are different notions of diversity in business, whether it is the business of a private corporate enterprise, or the business of a college or university. For many, diversity means whatever the business leaders or administrators say it means, which is often a matter of what they believe will placate public opinion in case their business is accused of racism or sexism, for instance. After all, few businesses these days wish to be accused of racism or sexism, as that would be bad for business. This is especially true of US private and public colleges and universities. So such businesses go to some lengths to make it appear as though they are not racist or sexist by hiring “persons of color” and mostly white woman in publicly viewable positions so that if the business is accused of racism or sexism, there is at least the *prima facie* public relations reply in hand that the business is not racist or sexist. In increasing numbers of cases, businesses hire such persons in order to create and sustain the public image of the business as one that fights racism and sexism, whether or not this is true.

So it is important to analyze the concept of diversity in order to separate ideas of diversity which come latent in them hidden agendas regarding public relations from those which have fundamental moral content regardless of public relations considerations. Diversity in business might be construed in a rectificatory manner. *Rectificatory diversity* is itself a diverse or complex concept. First, there is racial or ethnic diversity according to which a business hires a certain range of employees from a variety of ethnic groups and for a variety of reasons. Unlike the

above purely public-relations driven motive for diversity, this one chooses to hire employees from a variety of ethnic groups because it seeks to provide some form of rectification for the past evils against those groups in the history of the country in which the business functions and is registered as a legal entity. This makes this notion of diversity fundamentally backward-looking. But this backward-looking concept of diversity also respects the particular histories of such peoples, thereby seeking to hire employees from each group in albeit approximate proportion to that group's kind and level of experienced harmful wrongdoing. In the USA, this would imply that American Indians and US blacks would be atop of the hiring lists in businesses in that they have by far experienced the severest levels and kinds of oppression in and by the USA. Such a history includes the fact that each such group most highly targeted for affirmative action benefits has a lengthy history of high under-employment. Thus, the public policy in question seeks to address this problem.

Secondly, sexism has been experienced and continues to be experienced by women in the USA, and businesses which take seriously the task of rectifying sexism ought to concentrate their hiring efforts on women from the most oppressed ethnic groups (American Indians and US blacks) and then other women also. To the extent that businesses are serious about such rectificatory diversity, they will set aside scholarships for members of such groups to attend college and university degrees that will train them appropriately for their businesses. There could be scarcely a better recruitment tool for businesses wanting to engage in rectificatory diversity. Of course, diversity in promotion of deserving employees is crucial especially in terms of retention of such persons.

Of course, not hiring or treating women abusively in business is not the only manner in which a business might be sexist. It might be anti-homosexual, in which case it is important that businesses combat such pervasive problems by hiring qualified homosexual employees and by treating them with dignity and respect as with employees from every ethnic category. It has long been proven that even many persons who

function with stereotypes about those whom they do not know can be "taught" to respect them insofar as they are placed in positive cooperative contexts with them. While this is true, one ought not to be overly optimistic about the prevalence of racism and sexism as they are deeply seated realities in society. People's moralities are not easily changed, especially in adulthood. And the leftist addiction to sentencing certain employees to "sensitivity training" often has counter-productive results because of the perceived moral hypocrisy and moral arrogance that many exhibit who think that they are above racism and sexism and have the moral authority to sentence others, but never themselves, to such training. One difficulty with addressing racism and sexism in business is that no one seems to want to understand that everyone to some degree or another is racist and sexist. But the "diversity police," and they are many in the USA, seek to brand others, but never themselves, as racists or sexists, or both, not grasping that racism and sexism are, practically speaking, universal problems among adult in society (Corlett 2003: Chapter 4). *Rectificatory diversity*, humbled by the genuine understanding that each adult is to some degree or another a racist and a sexist, coupled with the hope that each of us would consistently engage in cognitive self-monitoring in order to combat our racist and sexist tendencies, would constitute a significant first step toward addressing and reducing racism and sexism in business where they are seemingly ubiquitous.<sup>5</sup>

## Conclusion

Racial and ethnic diversity in business is vital. It seeks to respect the differences that make for unified human excellence in the workplace and all that that might imply that is positive. But we must be cautious to not endorse overly permissive attitudes toward racial and ethnic identity which can eventuate in self-serving fraudulent actions, harming the members of the most vulnerable

<sup>5</sup> For an account of the cognitive universality of racism and how it might be addressed, see Corlett (2003: Chapter 4).

groups in society. Insofar as racial and ethnic diversity in business is important in business, self-identification is neither necessary nor sufficient as it can and does lead to incorrect or fraudulent identifications. A more promising standard is genealogical, substantiated by DNA and historical evidence. Rectificatory diversity in business would go a long way toward combating racism and sexism in business. Since business is such an important aspect in society, diversity in business would assist society in general in addressing fundamental concerns of racism and sexism.

## Racism in the Workplace

J. Angelo Corlett  
Philosophy & Ethics, San Diego State University,  
San Diego, CA, USA

## Synonyms

Discrimination in the workplace or prejudice in the workplace based on beliefs about the existence

and superiority or inferiority of different human races.

## Introduction

There is only one human race. Thus, it is a bit of a misnomer to refer to something as “racist” or “racism” insofar as it pertains to negativity concerning humans because of their perceived tie to a particular racial group. But humans belong to a mixture of ethnic groups which are socially constructed, and it is the perception that they do so that often leads others to treat them in what we refer to as racist ways. Rather than invent a new term, “ethnicism” to capture what we commonly refer to as racism, I will retain “racism” and its cognates in order to avoid confusion and the needless proliferation of novel academic terms.

## What Is Racism?

*Racialism* is the recognition that there are a plethora of ethnic groups some of which each of us humans belongs. Whether or not such groups are in part or in whole socially constructed is not the point of this article. Rather, it is to articulate a clear understanding of racism in the workplace. Racialism is not racism, though racism entails racialism because racism implicitly or explicitly involves the recognition that there are different races or ethnic groups. Recognizing that there are different ethnic groups and one human race, for example, is racialist; it is not racist.

*For purposes of public policy administration, racism* is the negative treatment of someone because of their perceived ethnicity. It is not just a matter of having a racist attitude toward another (ethnic prejudice); it is a matter of action (ethnic discrimination). It is the putting into practice ethnic prejudice, which is the having of a negative attitude or belief toward someone because of their perceived ethnicity (Corlett 2003: Chapter 4). The perception of another’s ethnicity may be correct or incorrect, and one might be racist against members of their own ethnic group as in instances of, say, racist self-hatred. Racism is a matter of

degree, as we are more or less racist contingent on the extent to which we engage in racist behavior (Corlett 2003: Chapter 4). Furthermore, racism is a matter of degree in that the racist's perception of another's ethnicity might play a primary or secondary role in her motivation to treat someone in a racist manner.

What makes racism even more complicated is that people are often mistaken, for whatever reasons, about their own or another's ethnicity. But the perception of another's ethnicity being correct is not necessary for whether or not racism is present in a social context. X might be incorrect that Y is a Mexican. But insofar as X treats Y poorly because of X's own perception of Y as a Mexican, X treats Y in a racist manner. Indeed, someone, perhaps even Y herself, informed X that she was a Mexican when she was not a Mexican, just to see how X would treat her. But if X, acting on that (false) information from Y about her own ethnicity, treats Y poorly because he believes that Y is a Mexican, then X treats Y in a racist manner. Thus, racism can be based on fact or falsehood concerning the nature of one's own or another's ethnicities (we are of mixed ethnicity; pure races and pure ethnicities are myths). But it can be racist nonetheless.

## Kinds of Racism

There are at least four kinds of racism in the business workplace: individual-to-individual racism, individual-to-group racism, group-to-individual racism, and group-to-group racism.<sup>1</sup> *Individual-to-individual racism* might occur when one employer or employee treats another poorly because of her perceived ethnicity. Perhaps she terminates her, or harasses her, or retaliates against her in some way or another. Or, conversely, the employee might treat her supervisor in a racist manner, spreading false rumors about her or speaking to her in a racist tone. *Individual-to-group racism* occurs when, say, an employer

treats a group of employees poorly because she perceives them as being members of a particular ethnic group. A white employer who treats her black employees poorly because they are black is surely racist against them. She might speak to them with negative tones, refuse to pay them what they are owed, write them undeserved performance reviews, etc., in retaliation against them due to their blackness. *Group-to-individual racism* occurs when the employer, say, a white management team, exhibits racism against a particular employee because she is, say, a Latina. They might harass her, or retaliate against her, or write or speak falsely and poorly about her because she is a Latina. But it is a group effort; collusion is involved by the team members against the individual employee. *Group-to-group racism* occurs in the workplace to the extent that an employment team colludes against a group of employees because of their perceived ethnicity or ethnicities. Indeed, it need not be the case that the employees in a particular case are from the same ethnic group. They might be from various ethnic groups. The key is that the employment management team singles out the employees because they belong to a certain ethnic group or more than one group. But what motivates racism?

## Motivations of Racism

It is popular among an increasing number of leftist feminist academicians these days to think that racism is motivated by power alone.<sup>2</sup> According to this view, only white males can be and are racists because they on average and as a class possess the power, and it is not possible for anyone else in society to be a racist because they lack power. On this view, power is a necessary motivational condition of racism (Alcoff 2005; Bailly and Cuomo 2008).

However, the power conception of racism is out of touch with what the science of cognitive psychology reveals about racism (Corlett 2003:

<sup>1</sup> This section is an adaptation of a section of Corlett (2003: Chapter 4).

<sup>2</sup> This section is an adaptation and significant elaboration of a section of Corlett (2003: Chapter 4).

Chapter 4) Racism does not begin and end with society and social structures as if structural racism tells us the entire story of racism. Socially structured racism, even in the workplace, is a symptom of the deeper cognitive origins and development of racism within individual humans in social contexts. Racist stereotypes are a good example here. They are spread among individuals within society and even within social contexts such as the workplace. However, they are rejected or accepted and developed within persons' cognitive architecture. And since all humans receive and process information in the same general manner, the likelihood of anyone not being a racist at least to some meaningful degree at some point of their lives is improbable to say the least. Thus, what motivates racism is of importance for the workplace, to be sure. And mere musings of a nonscientific nature by an enclave of dogmatic academics do not count for much in a scientific context. They often obscure the role that white feminism, in particular, has played in the racist oppression of those whom they themselves refer to as "persons of color" (Corlett 2010: Chapter 10).

However, to the science of cognitive psychology might be added a counterexample to the idea that power is either necessary or sufficient for racism. Indeed, one need only look to the aftermath of the infamous 1992 Rodney King verdict wherein live television displayed some angry blacks beating to near death an innocent white person, Reginald Denny. Denny's only "crime" was that he was white and was in the wrong place at the wrong time during the riots that resulted from the King verdict. The fact is that the blacks who almost killed Denny for no other reason than he was perceived to be white by those beating him had no power in any interesting sense of the word "power." Yet what they did to Denny was racist if anything is racist. It was an act of racist violence no more justified than the lynching of a black person was under the blind-eyed protection of Jim Crow. The fact is that anyone who really knows about us "people of color," as many white academics insist on calling us, we are no less prone to be racists than anyone else. And this is because we receive and process information no differently than anyone else, cognitively

speaking. No white leftist academic dogmas of male dominance (as true as that is) and solely power-motivated white male racism is sufficient to explain how power, white male power, is necessary for racism. It might assist in explaining the phenomena of white male racism, sociologically speaking. But power alone is neither necessary nor sufficient for racism, as the case of Denny demonstrates. To believe that racism is motivationally all about power or that it always originates from a position of power is as simplistic as saying, which is even more popular among many of today's leftists about whom they disagree over various political matters, that hatred is at the root of all racism. With implausible, simplistically extreme, and unscientific views such as these, it is no wonder that not much progress has been made on the front lines of combating racism – especially in the workplace. No one seems to think that they themselves can be a racist, and this despite the fact of experimental cognitive psychology informing us otherwise (Corlett 2003: Chapter 4; Dovidio et al. 1986; Eberhardt and Fiske 1998; Fiske 1998; Tajfel 1978).

The fact is that racism is far more complex than the notions that either power or hatred is a necessary condition of racism would have us think. Racism can be motivated by any disjunction or conjunction of at least the following: power, ignorance, fear, superiority, and hatred (Corlett 2003: Chapter 4). To this list might be added racism motivated by jealousy and envy.

Racism is often, but not always, motivated by an attempt to retain or gain power over others because of considerations of perceived ethnicity. In the workplace, power-motivated racism might take the form of writing unjustified and harsh performance reviews of employees out of jealousy, envy, hatred, perceived superiority over them as persons, etc. Indeed, it is precisely such racist power which can and often does form the social structure of racism in organizations and institutions wherein there exists a workplace.

However, racism can be motivated by ignorance in that the employer or employee exhibiting the racism does not even understand the true nature of those against she is performing the racist actions, inactions or attempted actions, as the case

may be. For instance, an employer might write a performance review or even terminate a Latina because she believes she, as a Latina, is lazy and unfit for managerial positions, a stereotype which as a generalization is plainly false.<sup>3</sup> But such ignorance about Latinas persists among many people, posing problems for the eradication of racism in the workplace.

Racism in the workplace can also be motivated by fear of the other wherein knowledge of the other is overshadowed by fear of them as a person who is perceived to belong to a particular ethnic group who might better compete with her for promotions and better performance reviews, etc. In such cases, it is often found that racists find ways to keep down the promotions and salaries of those whom they fear will outperform them, making them “look bad.” Fundamentally, this sort of fear-based racism can be intertwined with jealousy and envy, and even a sense of low self-esteem or, ironically, slothfulness on behalf of the racist who thinks that she is entitled to not be made to “look bad” even when she performs poorly. In such cases, there is a double-standard in operation which holds those of other ethnic groups to a higher performance standard than oneself.

Racism which is motivated by a perceived superiority of one's own ethnic group over others is often coupled with motivations of fear, ignorance, and power (coupled with jealousy and envy) in the desire to keep others down, refusing to promote or even hire those from what they perceive as competing ethnic groups in the business workplace. In such contexts, racism can often become institutionalized. Most people have stereotypes and prejudices against various peoples because of the ethnic groups to which they belong.

<sup>3</sup> It turns out that racism which is grounded in racial stereotypes quite often commits a logical fallacy of hasty generalization of the following form: “X is lazy, X is a Y, therefore, Y's are lazy.” The fallacy is in inferring that just because X is lazy and that X is a Y, that all Y's are lazy. If Y is a numerically large group, then it is hardly justified to infer that all Y's are lazy simply on the basis of X's being lazy. A sample size of one is hardly a sound scientific method by which to determine the sloth-status of Y as a whole.

Many fear blacks because they are black. The mere color of black skin sets off stereotypes of dangerous persons who are likely to do harm to others. This longstanding stereotype in US society is even prevalent among many blacks themselves! This stereotype often leads to the racist treatment of blacks as those whom one ought not to hire. Even worst, in the business of law enforcement, it can and does often lead to the over-reaction of law enforcement officers to black citizens, often leading to the use of lethal force when no such force is justified. One's superiority over blacks is so deep that it actually forms the belief in them that, say, whites are superior to blacks such that blacks are justifiably treated more harshly than whites given relevantly similar circumstances. But “relevantly similar circumstances” rarely become actualized when you are addressing longstanding racial difficulties between US whites and US blacks.

Jealousy is the resentful feeling one has toward another in wishing that one had what the other has. In the workplace, this might take the form of retaliation against an employee because the employee is highly successful while the retaliator is unsuccessful, comparatively speaking. Jealousy-based racism is the adverse resentful feeling someone has toward a member of another ethnic group wishing one has what the other has in terms of professional success, and doing what one can to set back that success of the other person one way or another. Envy entails jealousy. But it not only desires what another has achieved, it also involves making sure that if one cannot have the achievement for themselves, then neither will a particular someone else. When the target of envy is a member of another ethnic group, and if the reason for the adverse treatment against that other person is because of her ethnicity, then she has committed an envy-based racist act against her in the workplace. Jealousy-based racism and envy-based racism might be exemplified by way of workplace harassment, sexual or otherwise, workplace retaliation, or the like.

The results of these and other motivations of racism in the workplace have had devastating effects on US blacks in particular, and it appears that relatively few recognize the pivotal role that racism plays in US black underemployment. One

would expect, if one is fair-minded, that not only the often crippling effects of black slavery in the USA, followed by almost a century of often government-sponsored Jim Crow, followed still by the racism in the workplace throughout businesses in the USA, that blacks on average and as a group would continue to suffer unemployment and underemployment in significant numbers. There is little doubt that the effects of historic and contemporary racism against U.S. blacks goes a significant way toward explaining why so many such blacks struggle today to find gainful employment, and then struggle just as much to retain it without racist harassment or retaliation, etc. With the many motivations of racism in the workplace, it is a wonder how as many blacks do as well as they do. What ought not to go unnoted are the psychic costs of being black in the U.-S. workplace. Being the victim of racism in its many forms comes with a cost—no matter how successful someone becomes.

### **Racism and Intentionality**

In general, racism is a matter of intent. Racism does not usually happen accidentally. For one to be a racist, one must generally act with intent to harm another person because of their perceived ethnicity. It is stated “generally” in that there is at least one exception to this rule, namely, when one is ignorant about the racist results of their own action or its implications and treats another person poorly, but unintentionally. For example, the permissive treatment of harsh criminals “of color” is often a public policy with racist implications but without racist intent. It lacks racist intent because the very reason why many progressives are against harsh punishment of and in favor of early releases of harsh criminals of color is because such criminals originate from poor socioeconomic conditions wherein they did not receive a fair chance to succeed, thereby choosing a life of crime instead. However, given the statistical fact that most such criminals, when they are released, go back into recidivistic criminal behavior in the

same neighborhoods of color from which they came, the policies in question are racist because they adversely affect people of color in those neighborhoods, stifling their chances to succeed. Thus, while the intent of said policies is to assist criminals of color, the reality is that those people of color whom against whom they commit most of their crimes are less likely to succeed in life largely because of the policies in question. The policies have racist consequences, though unintended ones.

This same point needs to be considered in the workplace. A business ought to make sure that its policies are not racist, even unintentionally. One example of an unintentionally racist policy would be in the case of the business of universities wherein increasingly university administrations violate federal and state laws and even their own policies on academic freedom when they over-regulate student and faculty expressions that have a particular ethnic “minority” tone to it: “ghetto talk,” “barrio lingo,” etc. While in the name of “political correctness” the administrations often state that they are attempting to protect the feelings of those in their respective higher-educational communities, they nonetheless do so by violating the academic freedom rights of the ethnic “minorities” they seek to protect, which is racist, though unintentionally. Private business enterprises may set certain standards of basic conduct in the workplace. But they must steer clear, in the U.S. at any rate, of violating employees’ rights to freedom of expression, especially in the light of recently passed whistleblower protection legislation.

### **Conclusion**

Various kinds and degrees and motivations of racism persist in the workplace. And there is much confusion about what constitutes racism. This article has sought to clarify some of what racism is about in the workplace. Racism is far more complicated than the simplistic idea that it is necessary for racism that it be demonstrated only

by those in power. Unfortunately, it is more than mere white males who are racists. The cognitive psychology of racism explains that racism is many-faceted and runs rather deep into society as it is the result of how we often receive and process information. It is what we do with that information that is crucial. Do we evaluate it critically so as not to accept racist information and then allow it into our belief systems wherein it can fester and become a basis of action? Or do we critically evaluate such ideas and disallow them entry into our belief systems, thereby disallowing them influence of our actions? The bad news is that to some meaningful extent, everyone is a racist in the sense that each of us has engaged in racist behavior at some point of our adult lives. The good news is that we are not born racists because racism is a learned behavior. But whatever can be learned can be unlearned.

## Introduction

John Bordley Rawls (1921–2002) was born in Baltimore, Maryland, and was one of the most influential American political philosophers of the twentieth century. Rawls is responsible for putting egalitarian justice at the core of political theories since his *A Theory of Justice*, published in 1971. His theory of justice, called justice as fairness, advocates a democratic society of free and equal citizens with social and economic institutions capable of guaranteeing equal basic rights and fair conditions of social cooperation. Rawls also belongs to the liberal tradition of political thought, assessing problems of political legitimacy and public reason within pluralistic democratic societies in his work *Political Liberalism*. Beginners should consider reading first *Justice as fairness: a restatement*, which contains an abridged and corrected version of his *magnus opus*.

## The Fundamental Ideas of Justice as Fairness

Rawls's theory of justice begins with six basic ideas, all drawn from the public political culture of democratic societies. Rawls assumes that ordinary citizens have an implicit understanding of these ideas, using them in everyday political debate. Political philosophy aims to systematize

these ideas into a coherent and unified political conception, guiding the discovery of common political principles to justify social cooperation among citizens. Since we live in pluralistic democracies, Rawls's theory of justice is restricted to society's political dimension, leaving free space for different philosophical, moral, or religious worldviews (Rawls 2001).

The six fundamental ideas are: society as a scheme for social cooperation, free and equal persons, well-ordered society, basic structure of society, public justification, and original position (Rawls 2001, Part 1).

According to Rawls, democratic societies are systems of social cooperation between equal and free persons. At its most general level, social cooperation is an activity guided by fair and reciprocal rules and procedures recognized by all its participants. It also presupposes that acting together produces more benefits than living solely by one's own efforts. Thus, everyone has a rational advantage of living in a just society. Even if social cooperation may occur in different levels of generality (from private and local to anonymous and global), Rawls considers only interactions within social institutions.

Citizens are considered free and equal persons who cooperate with each other. As a political idea, Rawls assesses only the aspects that allow persons to be fully capable of engaging in social cooperation throughout their lives. Rawls considers two specific moral powers: the capacity to have a sense of justice and the capacity to develop and pursue a particular worldview, with certain final ends and values. In a just and democratic society, persons are free because their worldviews (their moral identity) are independent of political values. In other words, they do not have their political status as citizens or the legitimacy of their political claims determined by their beliefs and creeds. Persons are also equal, as they are considered to have the minimum moral requirements for social cooperation.

With these two basic ideas, the complete realization of a just society is articulated through the idea of a well-ordered society. In this highly idealized society, Rawls wants to stress what a

society effectively regulated by a political conception of justice would look like. Each citizen acts fairly, that is, in accordance with the principles of justice and knows that other citizens and political authorities also act in that way. The political conception of justice becomes a common and public point of view accepted by all its citizens, and this is mutually recognized.

With these initial ideas, we can see that Rawls is not precisely describing reality. He intends to develop an ideal theory, assuming favorable social conditions and strict compliance by citizens with the principles of justice. Only from the point of view of an ideal theory of justice do we better understand the main political and social problems we face. Thus, we can offer a criterion for judging whether or not we are advancing in nonideal conditions of justice. At the same time, Rawls wants to offer a conception of justice that is feasible given the conditions of the human world. That is why he calls his theory a realistic utopia.

The idea of the basic structure of society denotes the main political, social, and economic institutions of a democratic society and how they are articulated to fairly distribute rights, duties, opportunities, and wealth. The constitution, the separation of political powers, the economic system, and the family are institutions that belong to the basic structure as the background social framework for cooperation. The basic structure of society is the unity of analysis of justice as fairness. Hence, the principles of justice apply directly only to it, not to individuals, neither to civil associations.

Rawls understands the idea of public justification as a form of justification for conflicting political judgments through a shared and public basis of political justice. When citizens clash over solutions to political problems, they must appeal to beliefs, reasons, and values that all other citizens can reasonably recognize or adhere to, regardless of their worldviews. Through public reason, justice as fairness seeks to delimit moral disagreements only to constitutional essentials. It does not expect us to have a complete agreement on all political, moral, religious, and philosophical issues.

## Original Position and the Principles of Justice

The idea of the original position aims to provide a political justification for choosing the principles of justice that will regulate the basic structure of society. Its intuitive idea is to establish, through a thought experiment, fair initial conditions of agreement between free and equal citizens. The original position plays the same role as the state of nature for the social contract tradition. Nonetheless, in a democratic society, this choice cannot be made based on power relations, neither on some particular philosophical or religious worldview. For this reason, the original position is modeled with democratic and reasonable restrictions that we use in everyday situations (such as impartiality and equality).

The most notable feature of the original position is the veil of ignorance to which the parties are subjected. Rawls (1999, 2001, §25) is skeptical about the possibility of choosing principles based on private and contingent information because it distorts and influences our choices. Therefore, the veil drastically restricts what we know about ourselves by deliberating on principles of justice. Under the veil of ignorance, we do not know our social position, economic class, race or ethnicity, gender and sexual orientation, our conception of the good and lifestyle, and our natural gifts and intelligence. We do not even know about the situation of our society and the advantages (or disadvantages) resulting from historical processes of inequality. Thus, all parties are in symmetrical positions, having only their minimum moral faculties of rational decision and the knowledge of very general facts about human society.

Another essential feature of the original position is how the parties deliberate. As artificial constructs, they are purely rational and mutually disinterested. The parties have a preference for the principles of justice that guarantee greater sharing of what Rawls (2001, §17) calls primary goods. Thus, they seek to achieve the best social conditions and the social goods necessary to develop their lives and worldviews (whatever it may be). It

is worth noting that the parties are not purely selfish or altruistic since the original position prevents this type of reasoning.

To illustrate the importance of this hypothetical experiment, let us take the example of slavery. Under the veil of ignorance, the parties in the original position will not choose a social system that admits slavery. Since they have no way of knowing which social position they will hold, it is rational to exclude this possibility. The same could be thought of principles that would admit discriminations toward specific social positions or exclude reasonable forms of life. Would it be rational to choose unfair principles for women or persons of a particular sexual orientation? Would it be rational to choose to live in a society where economic and political inequalities are irrelevant and persons in extreme poverty are completely disregarded? In other words, this thought experiment forces us to ask the following question: what principles of justice would we choose for the basic structure of society if we established a social contract to choose the economic and social conditions necessary to live a decent life, ignoring everyone's personal characteristics?

The original position is essentially a device of selection by comparison that aims at equality. As a "deliberative machine," it receives inputs (principles of justice from different political conceptions) and, as an output, it establishes a ranking of preferences among them, according to the rationality of the parties in guaranteeing primary goods.

So, what principles are competing in the original position? Rawls was essentially concerned with only two specific political conceptions: justice as fairness and utilitarianism. In short, utilitarianism argues that a society is fair when the basic structure maximizes the total aggregate level of utility (the most plausible version maximizes the average level of utility *per capita*). According to Rawls, utilitarianism fails to consider the independence of each person and does not establish fixed liberties and rights for all citizens. As a result, we do not have sufficient guarantees that we will have a social position with adequate minimum conditions. The distribution of rights,

opportunities, and welfare will constantly fluctuate according to the calculus of utility (Rawls 1999, §5–6).

Justice as fairness is a political conception formed by a set of two principles of justice:

- (a) Each person has the same inalienable claim to a fully adequate scheme of equal basic liberties, which scheme is compatible with the same scheme of liberties for all.
- (b) Social and economic inequalities are to satisfy two conditions: first, they are to be attached to offices and positions open to all under conditions of fair equality of opportunity; and second, they are to be to the greatest benefit of the least-advantaged members of society (the difference principle). (2001, p. 42–43)

The first principle establishes that basic liberties must be distributed equally to all, such as individual liberties (freedom of thought and liberty of conscience), political liberties (the right to vote and to participate in politics), freedom of association, freedom from psychological oppression and integrity of the person, and finally, liberties related to the rule of law. This principle receives priority for Rawls (2001, §30), which means that it will be part of the essential constitutional elements and cannot be exchanged for other types of rights, opportunities, or income and wealth.

The second principle has two parts. The first one requires an institutional arrangement that guarantees fair opportunities for all. Rawls (2001, §16) wants to eliminate the advantages that individuals could have from exclusively contingent facts of life (such as native endowments, good and bad fortune, and social class of origin) and to disregard opportunities based on merit. Rawls stipulates fundamental institutional conditions that allow everyone to have expectations of social success regardless of their social position. Public services such as universal health, education, and training are part of the social institutions listed by Rawls. The second part expresses the controversial principle of difference, whose function is, succinctly, to admit inequalities of income and wealth between individuals. But these inequalities are only legitimate as long as the least-advantaged benefits from them. With this

principle, Rawls (2001, §18) maintains concerns with economic efficiency coupled with moral issues about inequality.

Now, we can understand the argument from the original position. Rawls argues that we must choose a political conception that guarantees minimum social and economic conditions for a decent life after removing the veil. Thus, we would choose the principle whose worst result is superior to the worst result allowed by other principles. It is part of the veil of ignorance logic that we do not know whether we will be part of the more or the less advantaged group. So, we choose from the point of view of the least-advantaged. Rawls (2001, Part 3) claims that his conception has advantages over utilitarianism, because justice as fairness guarantees a constitutional scheme of basic liberties. Liberties and rights become constitutionally fixed and do not depend on calculations of social utility. Also, fair equality of opportunities and the principle of difference express a reciprocal relationship between citizens, downsizing the role of empathy and altruism.

The choice of the principles of justice does not end the argument of the original position. After this stage, Rawls (1999, Part 2) develops, albeit somewhat abstractly, the different stages of application of the principles. In this moment of the theory, Rawls shows how justice as fairness will establish and guarantee its principles through the arrangement of political, social, and economic institutions (the basic structure of society). To a large extent, Rawls defends a democratic constitutional regime with liberal content. This means that society is organized in such a way that it does not take any worldview as privileged.

## The Problem of Stability and Moral Psychology

The problem of stability has received considerable attention in recent years. It is crucial to keep in mind that this problem is the second argument of justice as fairness. In the first argument, the parties (under the veil of ignorance) are confronted with the choice of the principles of justice that will guarantee their fundamental interests. Now, they

wonder whether this political conception, established in a well-ordered society, will engender its own support from its citizens. In other words, while the first argument faces a problem of collective rationality, the second argument deals with a possible conflict between collective rationality (the common good) and individual rationality (the individual good).

The solution to the problem of stability is based on two arguments. The first one employs a moral psychology to investigate how citizens who grow up in a fair society will acquire a sense of justice strong enough to contain destructive psychological tendencies (such as anger, envy, resentment) and adapt their worldviews and expectations to mutually agreed terms. Rawls' moral psychology is normative and seeks to describe the main moments of political life through the capacities of moral powers (Rawls 2005, §8).

This first argument is, to some extent, circular. It assumes that persons with a sense of justice based on justice as fairness will desire to be fair in a society effectively regulated by justice as fairness. Here, Rawls wants to show that proper institutional functioning will encourage political virtues to promote cooperation. This means that citizens will not only be able to resist the temptations of injustice; they will also have the desire and the capacity to be fair. Rawls argues that a democratic society is more than a mere *modus vivendi*, that is, an accommodation of tolerant citizens who obey the laws by fear of punishment. In a well-ordered society, citizens will develop their moral faculties through the influence of public debate and the values of trust and respect.

The second argument deals with the relationship between the political conception of justice and citizens' worldviews. Rawls's central concern here, especially since the 1980s onwards, is to specify how a liberal democratic society could deal with the pluralism of different worldviews. Rawls wonders if, disregarding the motivation from the sense of justice, would citizens still have motivations to join and engage in fair actions.

Rawls (2005) defends the normative ideal of an overlapping consensus, in which persons with

different worldviews could adhere to the same political conception, establishing a public and shared point of view. This public justification procedure will provide the political legitimacy and stability necessary for a political conception to last over time. The theory of justice thus understands the fact of pluralism as a permanent feature of democratic societies, which are incompatible with the attempt to impose, in an oppressive way, a single worldview on its citizens. For this reason, as previously mentioned, a political conception of justice is restricted to the basic structure of society, remaining neutral in relation to the different worldviews and conceptions of the good of its citizens.

One last word on Rawls's methodology. In ordinary day-to-day political discussions, we make a lot of judgments at all levels of generality. We discuss the impact of government economic decisions in our city or neighborhood, particular social policies, such as affirmative actions or gender quotas in universities, or the foreign policy of our country. The collection of our most important political judgments is the expression of our sense of justice. Nonetheless, sometimes these judgments may be inconsistent with each other or obscure, without a clear vision of their political and practical consequences. Here, Rawls (1999, §9; 2001, §10) urges us to consider a process where we can go back and forth between our intuitions and our sense of justice to achieve a coherent and consistent conception of justice. This process of adjustments between both ends is the method of reflective equilibrium. In justice as fairness, this method functions as a process of moral justification. Citizens' political convictions must match with their vision of a fair society.

## Religion

Martin Schlag

Catholic Social Thought at the Center for Catholic Studies, University of St. Thomas (Minnesota), St. Paul, MN, USA

Pontificia Università della Santa Croce, Rome, Italy

## Synonyms

Faith; Religious humanism; Spirituality; Transcendence

## Definition

Even though there is no general agreement on a precise definition of its nature, religion is a universal and permanent phenomenon found in all human cultures. (Antes 2012). Religion entails the belief in the existence of God or at least of a sacred or transcendent reality that we can encounter and that requires some responsive action by the subject of religious experience. Religion also includes some kind of organization, a system of teachings, moral guidelines for life, rituals, and rites. An element of organization and visible identity distinguishes the notion of religion from that of merely interior faith and spirituality. Religion thus denotes a socially

perceptible group, and there is a plurality of religions worldwide (Feil 2012).

## Religion in Contemporary Society

According to the Pew-Templeton Global Religious Futures Project, 83.6% of the global population professes an affiliation to a religion. Among them are Buddhists (7.1%), Christians (31.4%), Hindus (15.0%), Jews (0.2%), Muslims (23.2%), Folk Religions (5.9%), and other religions (0.8%). People who are unaffiliated to any religion (but not necessarily atheistic or agnostic) make up 16.4%. (<http://www.globalreligiousfutures.org/>. Data of 2010).

Globalization has increased interreligious contacts in the working place. This might be one of the reasons why interest in religion, philosophy of religion, and related topics has grown strongly over the last years (Meister and Copan 2007, pp. 1–2; Wainwright 2005, pp. 1–11).

There are nations in which religion and political power are not separated, and religion dominates over the power structure of the State. Currently, this is the case of Islamic States, which are based on Islam and Islamic law (Shari'a), and religious freedom and other freedoms are extremely limited. In modern Western societies, in contrast to medieval ones, religion is separated from public life in varying degrees. Religion is generally considered a private affair, and the civic right to religious freedom protects individual religious convictions. The public sphere, in contrast, is, again generally speaking, secularized. This means that religion has no direct control over political, economic, military, and other public decisions. On the other hand, civil political authorities refrain from interfering in the internal affairs of religious organizations as long as they act within the limits of the public order. Such a relationship between religion and society is called "secularity." It is positive because it allows for a mutually advantageous and enriching dialogue between faith and reason, and between religion and society. Without the voice of reason religion can become fanatic or fundamentalist. On the other hand, without openness for transcendence reason can easily shut itself off against religious wisdom (See Benedict XVI

2010). People who think they know all answers to all questions inevitably fall into the trap of not realizing that they do not know the unknown. Religion and revelation can help us to remain receptive for truth and wisdom. Unfortunately, the struggle over the past centuries against the political privileges of the clergy has led not only to secularization (the confiscation of church property) but also to secularism. This means the exclusion of religion from the public sphere and the imposition of nonreligiosity as only possible public and official stance. Such exclusion negates religious freedom.

Post-modernity and contemporary society, in contrast, are experiencing a revival of religion also in the public sphere, and are questioning the modern consensus on the exclusion of religion (Pfeifer 2015, p. 368; Fort 1997, p. 267; Casanova 1994, p. 5). This admittedly contains risks: People rightly resent indoctrination by others who think they are God's mouthpiece in politics and business (Enderle 2003). Nevertheless, some have presented sound reasons for including religious arguments in the public square:

- Religious affiliation creates identity and community beyond mere citizenship. Without it the awareness of social belonging would be seriously weakened (Williams 2013). We create out identity in the groups that are closer to our upbringing and development in childhood: our family and friends, neighborhood, our cultural communities, and religious groups. We are attached emotionally to those closer to us. The more a nation or a political community is aligned with such primary sources of identity the more it can count on the support of its citizens, and the stronger will obedience to law be. On the other hand, the law of the land is the same for all. Human rights, the equality of man and woman, and the dignity of the human person must not be conditioned by religious affiliation (Menea 2016).
- Conflicts over what is good are sometimes motivated by religious beliefs, and such moral conflicts are central to leadership. If they were permanently excluded, organizations would

lack depth and suffer from "moral muteness" (Roels 2002, p. 34). Beliefs shape behavior. We are all brought up hearing stories of what the society we grow up in considers to be success. These narratives form our moral and cultural code, which in turn, influence the way we do business. There are thus different modes and mentalities in business shaped also by religion. In a globalized world, businesspeople increasingly are confronted with these differences that are not solved by ignoring them. Leadership requires knowledge of and respect for religious convictions.

- The narrow rationalism of modernity needs to open up to a horizon of meaning and sense for which religion is constitutive. (Rossouw 1994, p. 561). Understanding means integrating facts and new situations "into meaningful wholes through a personal commitment to some kind of vision of how things ought to be." (Zimmermann 2015, p. 69) Science can explain the causes of facts but not their significance, meaning, and relevance for the narratives that make up the moral sense and purpose of actions in general and of business in particular.

Religions that do not sufficiently reflect on their teachings in a rational and critical way certainly also have a "dark side." They can be dangerous to society and business. Among these dangers are intolerance, even violence and terrorism, indoctrination, and fundamentalism. Unfortunately these negative sides of religion are a daily reality. They highlight the responsibility of religious leaders and of believers to work for peace and tolerance. Despite this "dark side of religion" we can note the following positive effects of religion as stated in business ethics literature.

- Religions provide ethical standards and a source of motivation which can be more effective for many people than philosophical moral theories. Motivation can include willingness to follow the will of God, belief in an afterlife, and eternal retribution for conduct. Furthermore, religions go beyond normativity by providing narratives of meaning and personal

identification. Thus religions instill aspirations to moral greatness and to virtues beyond norms. Religious morality not only prescribes conformity with codes of conduct but strives to fulfill an ideal vision of what it means to be human being. Religions help to maintain the balance between justice and mercy, spirituality and materialism. Without this balance business would become soulless and unjust (Meir Tamari 1997, p. 46; Williams 1986).

- Religions have a common ethical heritage and share a common concern for the poor and those in need (Enderle 1997, p. 2). In Catholic social teaching, for instance, this has been formulated as the logic of gift in business dealings and as the need of an economy of inclusion (Benedict XVI 2009; Francis 2015).
- Religions thus play an important role in business ethics by raising a critical or prophetic voice denouncing social and economic injustice. This stimulates reflection by bringing topics to attention that usually escape a businessperson in his or her normal everyday dealings, and provokes action (Calkins 2000).
- Some religions prescribe specific ethical behavior in economic contexts that are not generally shared by Western business ethics. Islam, similarly to the medieval Christian tradition, for instance, forbids certain forms of interest as *riba*. This has given rise to Islamic finance (Mews and Abraham 2007). Such religious distinctions can provoke thoughts on how to reform the existing economic and financial system.

Transcendence and business ethics

### Introduction

Religions entail beliefs, rituals, practices, institutions, morality, and spirituality. They contain moral values and precepts, and these can be applied to business; indeed, such norms sometimes explicitly refer to business conduct.

Spirituality focuses on the individuals' drive to experience transcendence, or a deeper meaning to life, through the way in which they live and work (Giacalone and Jurkiewicz 2003). It can be seen as "the experience of consciously striving to integrate one's life in terms not of isolation and self-absorption but of self-transcendence toward the ultimate value one perceives. If the ultimate value is the Transcendent itself, the Deity, the spirituality is explicitly religious" (Schneiders 1986, 266–7).

Although spirituality has traditionally been associated with religions, it is nowadays presented as something independent of them. Spirituality is, however, an essential element of religion, one which gives it life and animation based on a certain view of God or divinity, the human being, and the world.

Whether or not spirituality is associated with a religion, it entails a certain sense of morality, including values, and, therefore, an understanding of good and what constitutes right or virtuous behavior. The rational structure of such morality is at the base of ethics, and therefore of business ethics.

## Spirituality at the Core of Any Authentic Religion

Spirituality is fundamental to any authentic religion, thus for all of the principal religions. Judaism emphasizes the law (Torah), but in a spiritual context based on faith in the one God and the conscience of the covenant between God and his chosen people. Biblical prophets preached spiritual disposition and leading a virtuous life with reference to God. They encouraged virtues such as justice, compassion for the suffering, an attitude of repentance with a truly humble and contrite spirit, and a peace-loving disposition. Christianity includes the Ten Commandments and the other moral precepts of Hebrews (Old Testament of the Christian Bible) but all of this is summarized in spiritual love for God and one's neighbor. The Spirit of God moves the fellowship of Jesus Christ, who revealed God.

Islamic faith also has a spiritual sense, in understanding that any act is potentially an act of worship, and many other precepts which explicitly refer to business. Good behavior requires upright intention and acting within the limits prescribed by God. Accordingly, work (*amal*) and business-related activities may be regarded as acts of worship and therefore moral if they meet these two conditions (Ahmad 1995).

Hinduism, the third largest religion after Christianity and Islam, is deeply spiritual. Righteousness or the "right way of living" in Hinduism requires one to act in accordance with a cosmic order that makes life and universe possible. Actions are oriented toward *Moksha*, understood as liberation or salvation, and associated with a birth-rebirth cycle (reincarnation). In Buddhism, spirituality is so important that it is considered a path to *spiritual* progress toward *Nirvana* or liberation. Confucianism and Taoism, the two principal traditional Chinese religions or wisdom traditions, also have a deep spiritual root. Confucianism seeks *spiritual* development, – something more than physical, emotional, and mental development – and takes "Heaven" (*Tian*), a kind of impersonal high ancestral like a force controlling the world, as an important reference. Taoism has a transcendental view of existence and, rather

than a set of norms, presents a philosophy of life. Spirituality is also central in African, American, and Oceania indigenous religions.

Religion without spirituality would be a cold worship system, maybe useful for creating social cohesion but lacking soul. However, throughout history there have been those who reduced religion to its institutional dimension (faith statements, rules, organization, practices) and ignored the deep attitudes of religious people (beliefs working in the heart, values, morality). In taking this path, religious ethics is reduced to the cold legalism of a rigid checklist of ethical norms.

In contrast, others have reduced religion to spirituality or have erected spirituality without any religion. This is the case of secular spiritualities.

### Secular Spiritualities

People who identify themselves as “spiritual but not religious” usually present spirituality as subjective experience of a sacred or transcendent dimension of the human being and the self-understanding of the deepest values and meanings by which people live.

One of the first to defend a secular or nontheistic spirituality was Iris Murdoch (1971), an Irish novelist and occasional philosopher. She suggested a moral vision connected with a transcendent source of goodness and beauty. The Czech writer, political dissident and later president of the former Czechoslovakia, Vaclav Havel (1990) was another proponent of nontheistic spirituality. For Murdoch and Havel living truth and other transcendent values was the way of connecting spirituality with morality.

Secular spiritualities usually emphasize values, and a wide body of literature suggests that some key values can be correlated with individual spirituality. Among these are *benevolence*, or the consistent expression of kindness and consideration toward others; *generativity*, or a demonstrated concern for the long-term impact of one's actions; *humanism*, or the practice of treating others with dignity; integrity, or the adherence to a code of

conduct; *justice*, or the equitable treatment of others; *mutuality*, or recognizing the value of individual contributions in creating the whole; *receptivity*, or an open-minded orientation; respect, or treating others with esteem and value; responsibility, or following through on goal attainment; and *trust*, or being one on whom others can consistently depend (Giacalone and Jurkiewicz 2004). These values, which are generally seen as transcendent, are not too different from values presented by most religions.

Advocates of secular spirituality often stress that it is free from religious dogmas, institutions, and rituals, and in a certain sense even more genuine. Some, probably with a legalistic view of religion in mind, go further, presenting spirituality in opposition to religion. Thus, the statement: “While religions often direct people outward toward social rites and rituals, spirituality directs one inward toward the wealth of knowledge, sense, aspirations, feelings one harbors within” (Marques et al. 2007, p. 10).

Paradoxically, those who embrace secular spirituality often fall into syncretism by living in accordance with an amalgam of beliefs or spiritual practices (i.e., yoga, meditation, development of mindfulness, etc.) from a variety of established religions.

Secular spirituality is accepted by some and criticized by others. The principal criticism is that being free of any religion comes at the cost of accepting ambiguity and going without the support of the clear and solid authority of a Superior Being (God) as the ultimate author of the transcendent values. The second regards the difficulty of constructing a rational ethics from private spirituality and passing this on to future generations, in contrast to spirituality which is rooted in institutional religions.

### The Link Between Religion/Spirituality and Business Ethics

In order to recover the role of religion and spirituality in ethics Spohn (1997, 111) suggested

distinguishing morality and ethics as two different but related categories. “Morality” can be understood as a “first-order” descriptive account of the lived experience of human values and obligations – embedded into spirituality – while “ethics” refers to the “second-order” reflection that probes the rational supports and systematic interconnections of these values and obligations.

In the first stages of the modern movement of business ethics, from the late 1970s, religious approaches were generally excluded. Philosophical approaches were dominant; especially those based on a priori principles taken as self-evident to reason, as the moral philosophy of Modernity suggests. Other aspects of human nature, such as feelings, the character of the agent and the human openness to transcendence – as well as the necessity to search for meaning and the connection of ethics and human flourishing – were all ignored.

In consequence, business ethics was seen as applied ethics based on principles developed in the moral philosophy of Modernity, such the Categorical Imperative (Kant), the Utilitarian Principle, the Principle of Impartiality or fairness (Rawls), social contract duties, or even standards based on morality for agreement (Gauthier).

However, this philosophical stream has been critically challenged, among others by Elisabeth Anscombe (1958). This British philosopher questioned the deep reason for the moral norms of modern moral philosophy after abandoning the divine reference – in a certain sense moral philosophy of the Modernity suggests a moral law without any moral legislator. She argued that moral prohibition requires a transcendent source beyond the decision-maker. This source is God in Abrahamic religions (Judaism, Christianity, and Islam). Other criticisms to principle-based ethics came from Neo-Aristotelian virtue ethics – with Alasdair MacIntyre (1981) as one of the main proponents. Principle-based ethics were accused of paying insufficient attention to the character of the agent and of contempt for human flourishing. Religion and spirituality have both a transcendent source and a focus on the centrality of the agent.

Nowadays, virtue ethics is a well-accepted approach to business ethics, and one which opens the door to virtues proposed by religions and secular spiritualities for business ethics. In addition, it has provided valuable elements in business management such as corporate values, organizational culture, workplace spirituality, and leadership connect with religious or nonreligious spirituality.

Religions have been the source of morality for millennia and, in recent decades, much academic work has been done to introduce religious approaches to business ethics, although the case has not been the same regarding spirituality.

In practice, religions meet business and make a contribution to business ethics in, at least, three different ways:

1. *Inspiring business and management through principles and virtues.* Religions, with their inherent morality, can provide principles and virtues as guidelines applicable to business. This is the case, for instance, with the principle of respect for human dignity, which has Judeo-Christian roots, the Golden Rule and love of benevolence, central in Christianity, of compassion – highly relevant in Buddhism and in other religions – and egalitarianism (equality of everyone in God’s eyes) proposed by Sikhism, or by showing the greatest respect for all forms of life as Jainism defends. Other examples would be the Islamic values for entrepreneurship and the socioethical principles proposed by Catholic social teaching. Likewise, the Confucian values of *ren* (benevolence), *yi* (the ability to distinguish the right and wrong), *li* (being polite and respectful), *zhi* (wisdom), and *xin* (belief, trust, and innocence), and the principle of reciprocity and the importance of self-cultivation and virtues in Confucianism. Religious leaders can inspire business leadership. Spirituality also provides a deeper foundation for principles of international business ethics than legalistic and command-based ethics approaches (Jackson 1999).

2. *Providing specific norms of conduct.* Beyond generic principles, many religious texts deal with specific issues of ethics in business. Thus, Jewish scholars (Pava 1998, for instance) explore the Torah (the most important part of the Hebrew Bible) and Talmudic, and post-Talmudic texts, focusing on the ethical aspects regarding business contained therein. Some Christians attempt to integrate Biblical texts and other Christian tradition writings into business. Similarly, Islamic studies analyze key texts that can be related to business in the *Qur'an* and the *Sunnah* or *Hadith* (words, actions, and approvals of the Prophet Muhammad) or apply the *Sharia* (the Islamic law based on the *Qur'an* and the *Hadith*) to ethical issues in business activity. In this way, religious traditions shed light on a variety of business issues and stress responsibility in managing business. On its part, spirituality has been presented as a means for an intuitive perception of unethical business activities (Giacalone and Jurkiewicz 2004).
3. *Offering religious perspectives on business topics.* Such topics include, among others, profit-making, work within the organization, corporate social responsibility, ecology, marketing, and consumerism, responsible social investment, corporate social disclosure, and so on. There are instances of religions developing ethical concepts which have become relevant in the business context, for example, Islamic banking, Protestant and Islamic work ethics, and, inspired by the Christian tradition, servant leadership, environmental stewardship, and vocation (applied to business).

However, all of these contributions, though very valuable, are limited. They deal with moral aspects of business but religions and spirituality do not present a comprehensive business ethics, with solid rational support and systematic interconnections. A comprehensive business ethics must cover three levels of business activity: the “macro” level, which regards the morality of economic system where the business operates, the “meso” level, which studies moral aspects of

business within the free enterprise system – including the ethical dimensions of the organization and the relationship between business and society – and the “micro” level, which refers to ethics of individual behavior within an organization.

Facing this horizon, a business ethics founded on religious grounds needs further development. Regarding Judaism, though the same probably also applies to other religions, Moses Pava affirmed: “Jewish business ethics needs to grow out of an understanding of the needs of modern, complex economies but need not accept the status quo as binding” (Pava 1998, p. 66). Some religions have already advanced in establishing serious approaches to business ethics through theological developments in dialogue with modern business. Nevertheless, systematic and comprehensive treaties of a religious-based business ethics are still scarce, and much more work is required to reach this goal.

## Religiosity

Domènec Melé

IESE Business School, University of Navarra, Barcelona, Spain

## Synonyms

Devoutness; Piety; Relation with the Transcendent; Religious Coherence; Religiousness; Spirituality

## Description

While religion entails a set of objective elements (beliefs, spirituality, morality, rites, institutions, etc.), religiosity refers to how individuals or groups of people live their own religion or how their religious beliefs are held. In a certain sense, religiosity is the maturity of faith.

The religiosity of persons includes both their internal spiritual experience of religion and their religious practices and behaviors. In sociological terms, we can consider the religiosity of a certain territory or a country by measuring external manifestations or practices. For instance, for Christian religiosity, measuring the percentage of people baptized and those who attend religious services on Sundays.

There are also people who show religiosity without a clear affiliation to any religion, or whose practice of religion is sporadic. Others show spirituality instead of religiosity. In addition, the religiosity of some people is based on picking up elements from different religions. This is very rare in adherents of monotheistic religions but not so uncommon in people who follow certain Asian religions and wisdom traditions. Thus, a Japanese person might be, for instance, Buddhist in certain aspects, Confucian in others, and also attend Shinto ceremonies.

## The Phenomenon of Religiosity

Many people worldwide show religiosity. According to the 2015 Gallup International

Religiosity Index, based on a global survey, 63% of the world's population defined themselves as religious (irrespective of whether or not they attend a place of worship), 22% as not religious, and 11% affirmed that they were convinced atheists. Those who do not consider themselves religious may feel themselves moved by spirituality, recognizing and following values and experiencing a certain relationship or connectedness with the sacred and the transcendent. Finally, others can find a substitute for religiosity to give sense to the mystery of existence in an ideal of life, a political idea, or even a sport, which can become their object of devotion.

The psychological causes of religiosity are now studied by cognitive and evolutionary psychology of religion, while sociology looks at external and social manifestations of religiosity, such as religious practices and how religiosity mediates in social relationships.

Philosophical anthropology reflects on the deep causes of religiosity rooted in human nature. Human beings have a longing to explain the meaning of the mystery of existence, the cosmic order, and the ethical values and beauty which transcend the person. This quest is fulfilled through the Transcendent and relations with God, the divinity, or some other ultimate reality. Religiosity is the human answer to this spiritual need. Religiosity, as religious devotion, expresses a sense of committed relation, which recalls the etymological meaning of religion. According to Cicero, religion is derived from *relegere* "go through again," and for many other authors from *religare* – "to bind fast."

Social sciences often attempt to understand the contents of religiosity and its influence on different scopes of life. In particular, behavioral business ethics attempts to gain understanding of the influence of religiosity on ethical behavior in the business context.

Genes can have an influence on religiosity and the family environment where a child grows up even more so; however, the family influence may decrease in youth and adulthood. The wider socio-cultural environment can also have a certain impact, but what seems more decisive is the

freedom and willingness to refer one's activity to the Transcendent.

Religious affiliation is different from religiosity. Religiosity entails two key elements: congruence and intensity. Congruence refers to living in agreement with a religion, accepting religious faith and religious morality, and, above all, connecting religion with one's own mind and behavior. Intensity regards feeling or living one's religion more or less strongly.

A lack of congruence is evident when there is an external appearance of religiosity but the real adherence to religion is low, or when someone presents him or herself as religious through compliance with certain external practices but forgets the most essential spiritual content of religion. This is the reproach of Jesus to the scribes and the Pharisees when he said that they preached but did not practice, adding: "Woe to you, scribes and Pharisees, hypocrites! For you tithe mint and dill and cummin, and have neglected the weightier matters of the law: justice and mercy and faithfulness. These you ought to have done, without neglecting the others." (Bible, Matthew 23:2–3, 23). Another example of a lack of congruence would be those who present a behavior which is fragmented or only loosely connected with religion, or those whose acting religiously depends on the acceptance of doing so in the social context.

Religiosity can become religious fanaticism, which has been blamed for deadly conflicts, but religious fanaticism is a deformation of religiosity. This fanaticism is manifested as an uncritical zeal for one's own religion, often accompanied by violence, with a lack of understanding for other people's positions and even seeing them as enemy. More frequently, however, religiosity leads to acts of charity and altruism, with a motivation which, in many cases, can be very strong.

## Measures of Religiosity

One of the oldest constructs to measure religiosity was "religious orientation." The purpose was to distinguish between those who sincerely practice their religion, by accepting its teachings and

attempting to live accordingly (intrinsic religiosity), and those others who exhibit religiosity for networking purposes or for personal interest (extrinsic religiosity), such as a politician who goes to church to influence voters. “Religious orientation” is useful as a first approach but has been criticized for being too broad to understand religiosity and to develop measurement scales. Some authors distinguish several dimensions of religiosity, for instance, a cognitive dimension (acceptance of the doctrines of a certain religion), a practical dimension (attending religious services), and a spiritual dimension (having a personal commitment and a religious experience). An individual could disavow all doctrines associated with organized religions (belief dimension), not affiliate with an organized religion or attend (practice dimension), but still be strongly committed to a higher power and feel that the connection with that higher power is ultimately relevant (spirituality dimension). Similarly, The Duke University Religion Index (DUREL), a popular five-item measure of religious involvement, assesses three primary dimensions of religiosity – organizational religious activity, nonorganizational religious activity, and intrinsic religiosity (or subjective religiosity).

Social scientists have proposed many methods to measure religiosity, as well as religious beliefs and practices, religious moral values, views of God, attitudes to the Church, and other related constructs. Goursh (1984) criticized what he saw as a proliferation of unnecessary measurement of religiosity. Hill and Hood (1999) went on to compile 125 measures of religiosity and spirituality 15 years later.

## Religiosity in Business

The study of the consequences of religiosity in business dates back to Max Weber and his thesis on the influence of religion on the genesis of Capitalism. Although this thesis has been controversial, over time researchers have focused on a variety of consequences of religiosity in aspects of business in several fields. These include, among

others, the influence of religiosity in the meaning of work, the effects of religiosity on consumer attitudes and behaviors, as well as purchase decisions and other aspects of consumption, likewise relational trust, charitable giving, managerial decisions on ecological issues, and attitudes toward diversity. Other studies include the influence of religiosity on promoting different coping strategies in business, on attitudes toward business and money, propensity to take financial risks, and tax compliance.

Some research focuses on religiosity based on other-centeredness and self-renunciation and on its positive influence on mental health; on the effects in stress reduction and tolerance of adversity; and on the correlation between religiosity and self-esteem, happiness, subjective well-being, and a sense of meaningfulness.

Religious motivation has been largely ignored in motivational theory, although some argue that, together with the perceived sacred qualities of work and views of God, it may be a relevant predictor of behaviors within organizations.

Regarding diversity, there are mixed results. Some show that religiosity has a negative influence on accepting diversity while others make a positive association between a measure of the firm’s commitment to diversity and the religiosity of the firm’s management.

## Religiosity in Ethical Behavior

There are a number of studies on the influence of religiosity on ethical behavior, attitudes, and perceptions of business ethics, corporate social responsibility, sustainability, and dealing with diversity. Some compare the ethical behavior of people with and without religiosity, or with different degrees of religiosity, or analyze the influence of religiosity in formulating moral judgments in decision-making, attitudes on philanthropy, and ethical investment. One particular topic studied relates to the influence of religiosity into ethical sensibility; this includes attitudes towards professional and business ethics as well as towards corporate social responsibilities. Regarding the

latter, it seems that intrinsic religiosity promotes an ethical CSR attitude and negatively affects financially oriented attitudes toward CSR, whereas extrinsic religiosity stimulates the philanthropic CSR attitude.

Findings frequently show a positive impact of intrinsic religiosity on interpersonal engagement by fostering concern, benevolent attitudes, and the disposition to help others, as well as of the propensity for forgiveness. In addition, it seems that intrinsic religiosity has a curtailing influence on earnings management, fraud, and cheating.

However, religiosity and spirituality not always have substantial explanatory power in predicting the ethics behavior of employees in the workplace, and some scholars affirm that the relationship between religiosity and honesty remains elusive. Weaver and Agle (2002), in an influential article based on symbolic interactionism theory, affirmed that religious role expectations, internalized as a religious self-identity, can influence ethical behavior. Nevertheless, they added that relationships of religious role expectations to behavior are moderated by religious identity salience and religious motivational orientation.

Last, but not least, spirituality, in terms of both religiosity and secular spirituality, has been identified as a driver of leadership. Thus, in the Christian context, spiritual leadership follows the steps of Jesus, who led by example and with a leadership of servanthood. On its part, secular spiritual leadership is one with motivating values, attitudes, and behaviors. The term spiritual leadership is now quite common in leadership literature, and some researchers analyze the implications for the organization of spiritual leadership and seek correlations between this leadership model and leader-followers relationships. There is also interest in the impact of such leadership in fostering corporate citizenship behavior, as well as in other behavioral constructs and in organizational performance.

## Religious Freedom Restoration Acts

Kelly R. Eskew  
Kelley School of Business, Indiana University,  
Bloomington, IN, USA

### Synonyms

Religious antidiscrimination legislation

### Definition

Religious Freedom Restoration Acts vary in scope and impact. Some are viewed as enhancing religious freedom, while others have been sharply criticized for their discriminatory intent, if not impact.

### Introduction

Religious Freedom Restoration Acts (RFRAs) began with the support of a bipartisan, multifaith coalition focused on protecting individuals and religious groups from governmental infringement on their free exercise of religion guaranteed by the First Amendment of the United States Constitution. Following passage of the federal RFRA in 1993, a number of states passed similar RFRA laws founded on these same principles. In recent years, with the expansion of rights for gays and lesbians as well as a Supreme Court ruling in 2014 that extended free exercise of religion rights to for-profit corporations, a raft of apparently discriminatory state RFRAs have been proposed, although most were defeated or abandoned in the face of economic and political pressure from businesses and municipalities.

## Federal and State RFRAs: History, Purpose, and Controversy

### The Federal RFRA Law

The First Amendment states that “Congress shall make no law respecting an establishment of religion, *or prohibiting the free exercise thereof...*” (U.S. Const. Amend. I (emphasis added).) Free exercise of religion includes the right to believe or profess any religious doctrine, and prohibits the government from compelling certain religious beliefs or punishing the expression of beliefs with which it disagrees. Moreover, the government may not prefer one religion over another (Macleod-Ball and Sher 2015).

Religious beliefs may sometimes clash with the law. For example, adherents of the certain indigenous religions may ingest peyote, LSD, and other drugs as part of their religious practice, although use of such drugs is legally prohibited (Employment Division, Dept. of Human Resources of Oregon v. Smith 1990). The laws at issue are neutral in that they apply to all persons, but as applied to some individuals, the laws interfere with the free exercise of religion.

For many years, the courts addressed such conflicts on a case-by-case basis. In *Sherbert v. Verner* (1963), the Supreme Court addressed religious exemptions from neutral laws. The appellant, a Seventh Day Adventist, was fired for refusing to work on Saturday, “the Sabbath Day of her faith,” and then denied unemployment insurance (*Sherbert v. Verner* 1963). The Court held that the government may not impose a substantial burden upon the free exercise of religion absent a “compelling state interest” (*Ibid.*, 402–403). Courts generally applied the *Sherbert* test in the ensuing decades.

Then, in *Employment Division v. Smith*, decided in 1990, the Supreme Court held that religious beliefs do not exempt an individual from neutral laws of general applicability. (*Smith*, 494 U.S. at 879.) Justice Antonin Scalia, writing for the majority, explained that laws that may have the effect of burdening the exercise of religion “must be preferred to a system in which each conscience is a law unto itself.” (*Ibid.* at 890. Note that the law at issue in *Smith* prohibited use

of the drug peyote, which the appellants used as part of a religious ceremony in the Native American Church. Thus, the law was neutral in that all persons were prohibited from using peyote, but as applied to the appellants burdened religious practice.)

The *Smith* decision was perceived as a substantial threat to free exercise of religion by a coalition of legislators, religious leaders, civil rights, and other interest groups. (Macleod, 2.) The response was the federal Religious Freedom Restoration Act.

RFRA was passed by the United States Congress with near unanimous support from Democrats and Republicans in 1993, and signed into law by President Bill Clinton. (See, 139 Cong. Rec. S14,470 (daily ed. Oct. 27, 1993), 139 Cong. Rec. H2362 (daily ed. May 11, 1993), 139 Cong. Rec. H8715 (daily ed. Nov. 3, 1993).) RFRA explains that “laws ‘neutral’ toward religion . . . may burden religious exercise as surely as laws intended to interfere with religious exercise.” (42 U.S.C. 2000bb(a)(2).)

RFRA creates a statutory right to an exemption from laws and other government actions that infringe on religiously motivated conduct, unless the law is based on a compelling government interest, such as preventing discrimination. (42 U.S.C. § 2000bb-1(b)(1).) Additionally, the government must pursue such interests by the “least restrictive means” possible. (42 U.S.C. § 2000bb-1(b)(2).) The burden upon free exercise must be substantial to trigger RFRA’s protections, however, and minimal burdens on religious conduct are not protected.

In 1994, the Supreme Court held that RFRA did not apply to the states (*City of Boerne v. Flores* 1994). In addition to spurring some states to enact their own religious freedom laws, discussed below, the ruling prompted passage of the Religious Land Use and Institutionalized Persons Act (RLUIPA) in 2000. RLUIPA, as the name suggests, protects religious organizations from land use regulations, like zoning and historic designation laws, and other government actions that appear to target unpopular or minority faiths. RLUIPA, like RFRA, protects only against substantial burdens, a high threshold. RLUIPA

also protects prisoners in their exercise of religion, with some limitations. (42 U.S.C. § 2000cc *et seq.*)

### State RFRA Laws

After the Supreme Court ruled that RFRA did not apply to the states, some states, motivated by the same concerns that originally spurred passage of the federal RFRA, began to pass their own similar religious freedom laws. Other states, particularly in recent years and with the changing societal and legal views on rights for gays and lesbians, have passed laws that are styled as “RFRA” laws but appear to give businesses and individuals the right to discriminate based on sexual orientation and gender identity where religious-based motive is claimed (Dhooge 2016).

Thus, state RFRA laws can and do vary widely in their content and focus. Those states that have attempted to use RFRA-type legislation to allow discriminatory conduct have claimed that their laws are no different than the federal law. Such assertions should be reviewed.

### Controversy and Impact

RFRA has sometimes been used as a defense to accusations of discriminatory conduct, justified by religious exercise. For example, in the 1990s, landlords who refused to rent to unmarried or gay and lesbian couples raised religious objections as a defense to charges of housing discrimination. (See *Thomas v. Anchorage Equal Rights Comm’n* (1999), as an example of using religious freedom claims to discriminate in rental housing.) A more recent example involves an individual with information regarding child labor practices of his church who claimed an RFRA-protected religious obligation not to respond to a subpoena, violating a legal duty to cooperate in criminal investigations (*Perez v. Paragon Contractors, Corp.* 2014).

The 2010 Patient Protection and Affordable Care Act (42 U.S.C. § 18001 *et seq.* (2010).), known as “Obamacare,” mandated that employers provide contraceptive coverage without a copay in their employee insurance plans. (42 U.S.C. § 300gg-13(a)(4).) A number of companies filed lawsuits challenging this provision on grounds that the requirement violated the free exercise

of religion by the corporation, a right not previously recognized. In *Burwell v. Hobby Lobby*, the Supreme Court held that RFRA's protections apply to for-profit, closely held corporations. (573 U.S., 134 S.Ct. 2751, 2761-2775 (2014). According to the Internal Revenue Service, a closely held corporation is one where five or fewer individuals own more than half of the stock, directly or indirectly, at any time in the second half of the year. IRS Pub. 542. It may also include "S" corporations like Hobby Lobby that have not more than 100 shareholders, although all members of the same family are treated as a single shareholder. 26 U.S.C. § 1361 *et seq.*) The Court assumed that the burden was substantial and held that Hobby Lobby and other corporations could decline to cover contraception, regardless of the beliefs of the individual employees impacted. (*Ibid.* at 2779, 2785.)

While some have noted that the *Hobby Lobby* decision is limited to "closely held" corporations, a term that may invoke a small family-owned business, it is worth noting that ninety (90) percent of all U.S. corporations meet this definition (Closely Held Corporations 2017; DeSilver 2014). Hobby Lobby, for example, has \$3.3 billion in annual revenue, 23,000 employees, and over 600 stores (Hobby Lobby Corporate Profile 2017).

Prior to the *Hobby Lobby* decision, 20 states had state RFRA laws generally modeled on the federal RFRA. During the 2015 legislative session that followed, 16 states proposed new RFRA laws. Unlike the federal RFRA, most of the new legislation sought to expand free exercise rights to for-profit businesses. Additionally, as exemplified in the 2015 RFRA enacted in Indiana, these new laws allowed individuals and businesses to use religious freedom as a "claim or defense in a judicial or administrative proceeding, regardless of whether the state or any other governmental entity is a party to the proceeding." (Indiana Code § 34-13-9-9 (2015).) The concern with such provisions is that they allowed discrimination founded in religious belief as well as expanding free exercise of religion protections well beyond the boundaries of government action, and thus

beyond the scope of the First Amendment. Most of these bills failed.

Arizona's legislature sent Senate Bill 1062, which would have allowed those with sincerely held religious beliefs to refuse service to gays and lesbians, to Governor Jan Brewer for signature, but it was vetoed after public opposition by businesses such as Apple, Inc. and American Airlines (Arizona Gov. Jan Brewer Vetoes SB 1062 2014). Brewer noted the "unintended and negative consequences" of the proposed RFRA law (*Ibid.*).

Mississippi, however, passed a revision to its existing RFRA law, giving individuals and businesses the right to decline to provide "services, accommodations, facilities, or goods" based on a religious belief that marriage and sexual relations should be limited to "one man and one woman." (Miss. St. § 11-62 *et seq.* (2016).)

Indiana passed its RFRA over strenuous objection by both local municipalities and major Indiana-based corporations who decried its apparent license to discriminate. (Indianapolis' GOP Mayor Greg Ballard: RFRA Sends the "Wrong Signal" About the City and Our State (2015) Freedom Indiana, <http://www.freedomindiana.org/mayorballard>. 25 Mar 2015; 9 Major CEO's Tell Governor Pence: Move Quickly To Fix RFRA and Protect LGBT Hoosiers! (2015) Freedom Indiana, <http://www.freedomindiana.org/ceos>. 30 Mar 2015; see also, Hamilton, M.A. (2015) State RFRA's and the Intent to Discriminate: Why the State RFRA's Are in Trouble. Verdict, <https://verdict.justia.com/2015/03/30/state-rfras-and-the-intent-to-discriminate-indiana-as-a-case-study>, 30 Mar 2015.) Concerns were not alleviated by the presence of prominent leaders of anti-LGBT organizations at the signing ceremony for the new law (Cook 2015). Within days, then-Governor Mike Pence relented and signed an amendment that clarified that the new law did not permit discrimination based on sexual orientation and gender identity. (Ind. Code § 34-13-9-0.7 (2015).) However, Indiana lost as much as \$60 billion in revenue as the result of its RFRA legislation and the ensuing backlash (Slodysko 2016).

Arkansas similarly passed an RFRA law allowing discrimination against gays and lesbians, but

revised it prior to enactment at the governor's request (Reilly 2015).

The business impact and condemnation by both businesses and local political leadership appears to have quashed RFRAs proposed in other states.

## Reporters Without Borders

Alex C. Michalos

University of Northern British Columbia, Ottawa, ON, Canada

## Synonyms

Reporters Sans Frontières (RSF)

## Definition

Reporters Without Borders [Reporters Sans Frontières] (RSF) is the world's biggest NGO specializing in the defense of media freedom, which we regard as the basic human right to be informed and to inform others. (Reporters Without Borders 2019)

## Description

Reporters Without Borders was established in Montpellier, France, in 1985. Today, it is a “network of correspondents in 130 countries” with a headquarters in Paris. Among its most notable functions, RSF:

- “Provides information about the media freedom situation worldwide in French, English, Spanish, Arabic, Chinese, Russian, and other languages.”

- “Issues press releases every day about abuses against journalists and . . . censorship.”
- Annually produces the Press Freedom Index.
- Produces ad hoc special reports on particular issues.
- Mobilizes “public and government support” with “protests and awareness campaigns.”
- Organizes activities to free journalist hostages anywhere in the world.
- Provides journalists with “bulletproof vests and helmets . . . training in physical and digital security.”
- Provides journalists with “insurance and emergency hotline and information manuals.”
- “Registers as an interested civil party in judicial cases in order to support journalists . . . and provides legal assistance.”
- “Provides hundreds of assistance grants every year to threatened independent media.”
- Introduces “draft legislation that respects basic freedoms” and puts “pressure on governments and organizations.”
- Initiated the UN Security Council’s resolutions “protecting journalists in armed conflicts.”

The NGO has a broad and impressive set of supporters, including the American Express, Ford Foundation, Fondation de France, National Endowment for Democracy, Fondation pour les Droits Humains, and French ministries of defense, interior, culture, and foreign affairs. Equally impressive is its distinguished international awards, e.g., Association for Education in Journalism and Mass Communication’s First Amendment Award, International Association of Press Clubs Prize, Charlemagne Medal for European Media, Sakharov Prize for Freedom of Thought, and the European Commission’s Lorenzo Natali Prize (Reporters Without Borders 2019).

## Research Ethics and the Nuremberg Trials

Robert Dingwall

Dingwall Enterprises Ltd., Nottingham, UK

## Synonyms

Crimes against humanity; Human subject research; Nazi medical research

## Introduction

The Nuremberg Trials – more specifically the Nuremberg Doctors Trial – have achieved iconic status in discussions about research ethics. Few ethical debates, especially in medicine and life sciences, get very far without one or other protagonist invoking the events revealed at Nuremberg to justify their position. However, the very familiarity of the reference means that the real history and lessons of the court processes, and eventual judgements, have often been obscured.

## The Nuremberg Doctors Trial

The Doctors Trial was one of a series of trials held at the end of World War II, where participants in the Nazi regime were called to account for their conduct during the war (Annas and Grodin 1992). It took place in a US military court rather than the International Military Tribunal that dealt with the surviving political leaders. The judges and lawyers were all Americans, although there is evidence of consultation with UK legal personnel. Hearings ran from 9 December 1946 until 20 August 1947. Twenty-three defendants, all but one of whom were male, were before the court. All had worked as doctors in the military

or civilian services of the Nazi state. In summary, the charges were:

1. Conspiracy to commit war crimes and crimes against humanity as described in counts 2 and 3
2. War crimes: medical experiments without the subjects' consent, upon civilians and members of the armed forces of nations then at war with the German Reich and who were in the custody of the German Reich in exercise of belligerent control, in the course of which experiments the defendants committed murders, brutalities, cruelties, tortures, atrocities, and other inhuman acts
3. Crimes against humanity: committing crimes described under count 2 also on German nationals
4. Membership in a criminal organization, the SS

The experiments were grouped as High-Altitude Experiments; Freezing Experiments; Malaria Experiments; Lost (Mustard) Gas Experiments; Sulfanilamide Experiments; Bone, Muscle, and Nerve Regeneration and Bone Transplantation Experiments; Sea-Water Experiments; Epidemic Jaundice Experiments; Sterilization Experiments; Spotted Fever (Fleckfieber) Experiments; Experiments with Poison; Incendiary Bomb Experiments. The charges also incorporate the "Euthanasia Programme" "in the course of which the defendants herein murdered hundreds of thousands of human beings, including nationals of German-occupied countries. This program involved the systematic and secret execution of the aged, insane, incurably ill, of deformed children, and other persons, by gas, lethal injections, and diverse other means in nursing homes, hospitals, and asylums." Seven defendants were acquitted, seven sentenced to death, and the remainder to terms of imprisonment for periods varying between 10 years and life. At the end of the trial, the verdict set out ten criteria that should be satisfied for medical experimentation to be considered permissible. These criteria became collectively known as the Nuremberg Code. They state that:

1. The voluntary consent of the human subject is absolutely essential.
2. The experiment should be such as to yield fruitful results for the good of society, unprocurable by other methods or means of study, and not random and unnecessary in nature.
3. The experiment should be so designed and based on the results of animal experimentation and knowledge of the natural history of the disease or other problem under study that the anticipated results will justify the performance of the experiment.
4. The experiment should be so conducted as to avoid all unnecessary physical and mental suffering and injury.
5. No experiment should be conducted where there is an a priori reason to believe that death or disabling injury will occur; except, perhaps, in those experiments where the experimental physicians also serve as subjects.
6. The degree of risk to be taken should never exceed that determined by the humanitarian importance of the problem to be solved by the experiment.
7. Proper preparations should be made and adequate facilities should be provided to protect the experimental subject against even remote possibilities of injury, disability, or death.
8. The experiment should be conducted only by scientifically qualified persons. The highest degree of skill and care should be required through all stages of the experiment of those who conduct or engage in the experiment.
9. During the course of the experiment, the human subject should be at liberty to bring the experiment to an end if he has reached the physical or mental state where continuation of the experiment seems to him to be impossible.
10. During the course of the experiment, the scientist in charge must be prepared to terminate the experiment at any stage, if he has probable cause to believe, in the exercise of the good faith, superior skill, and careful judgment required of him, that a continuation of the experiment is likely to result in injury, disability, or death to the experimental subject.

### Responses to the Trial: Origin Myths

Origin myths are pervasive in human institutions (Malinowski 1926; Eliade 1998). They are stories about the past that help people to make sense of the present. In the case of organizations, occupations, and professions, like ethics regulators or ethicists, they explain why the institution is necessary and why its members or agents have a legitimate role in society. As such, they represent history in selective ways. In the case of research ethics regulation, the agencies that administer it, and the professionals who inform and staff those agencies, are presented as the inevitable and necessary response to the atrocities committed by Nazi doctors in the name of medical science. If we are to prevent such things from happening again, we must set standards and enforce them, with appropriate powers and resources conferred on the enforcers. Such appeals are, then, frequently heard when ethics regulation is criticized, on whatever grounds. They can foreclose discussion of whether regulations strike an appropriate balance between the interests of science, society, and individuals, on whether the preeminence given to consent is relevant in all situations, and on whether the interpretation and operationalization of regulations is over-zealous and heavy-handed. The invocation of the Nuremberg Trial and Code can be a way of shutting down discussion rather than developing it. Making this point takes nothing away from the historical significance of the events or from their continuing importance. However, it is to underline that we should never be afraid to apply the critical spirit of social science, rhetorical analysis, or philosophy to ask what someone is doing with a myth, symbol, or icon rather than accepting this without question. This is particularly important here because of the gap between the mythical version of the Nuremberg Trial and the account that a social historian would produce.

### Responses to the Trial: Historical

Three important features of the historical context are often overlooked by the Nuremberg Trial myth: Germany had the most advanced legal

framework for medical research of any country before 1939; the US legal team had great difficulty in showing that the Nazi research contravened international standards; and there was very little contemporary interest in the trial and its outcome.

The ethics of human experimentation had been called into question in France, the UK, and the USA as well as in Germany when medicine began to adopt more scientific approaches during the nineteenth century (Dingwall and Rozelle 2011). However, the challenges were more prominent in Germany than elsewhere, partly because Germany was the leader in scientific medicine. German doctors were doing more experiments on patients. Where other countries relied on informal sanctions by peers to control inappropriate research, Germany saw sufficient public concern to bring about state intervention. This is best documented for Prussia, where government intervention seems to have begun in the 1890s, leading to legislation and a formal directive to public hospital medical directors in 1900. While there were many loopholes and enforcement was limited, the French, for example, were shocked by the very notion of regulation at all. Controversies continued after World War I as German medical science tried to compensate for the seizure of its pharmaceutical patents by the victors. In 1931, all doctors contracted to the state were required to observe fourteen principles governing therapy and research. These were effectively those embodied in the Nuremberg Code and, in some respects, went beyond it in emphasizing the personal responsibility of research group leaders. The problem was that, by 1931, there was also a strong group of physicians arguing on nationalist and eugenic grounds that the sick, the weak, and the feeble-minded should be considered lower-priority candidates for social protection. The values of the democratic German state were not accepted by a sufficient proportion of the medical profession for the intervention to be effective.

This created a serious problem for the US legal team in the Doctors Trial (Hazelgrove 2002). They became worried that the defendants' lawyers were developing a persuasive case that the Nazi

medical experiments were not wholly exceptional compared to work in Allied countries. As this history has become better documented, through work on the Tuskegee Study (Reverby 2009) and on prison medical experiments in the US (Rothman 2003) or the Allies own wartime medical research (Schmidt 2015), this defense does not seem to be without merit. With some egregious exceptions, the experiments prosecuted at Nuremberg could be seen as the end of a continuum rather than as uniquely evil. When the prosecution team looked around for international standards against which the Nazi doctors could be tried, there were none. It seems that there was some hasty collusion between the prosecution team and the American Medical Association to produce a statement that became the foundation of the Nuremberg Code. Some writers suggest that prosecution witnesses flirted with perjury to imply that the AMA statement had a longer existence and established authority than was actually the case. It was certainly seen as important by the prosecutors and their medical advisers to construct the trial in such a way as to make Nazi research into an outlier so as to protect public confidence in the Allies' medical scientists and their research.

They might not have been quite so concerned had they realized how little interest the trial would attract. The international journalists went home as soon as the trial of the political leaders was concluded and there was virtually no coverage of the Doctors Trial in the British or American press. The first mention in the *Manchester Guardian*, for example, does not come until 17 July 1947, when it forms part of the background to a story about the British Medical Association being asked to endorse a draft of the 1948 Declaration of Geneva, a precursor of the Declaration of Helsinki, which was intended to create the international standard that the trial had shown to be missing. The next reference is on 28 November 1951, when the General Medical Council, which licenses UK doctors and accredits their training, refused to require new graduates to affirm their acceptance of the Declaration of Geneva. The early regulatory developments in the USA were driven mainly by a desire to buffer the Federal

Government from litigation (Stark 2012). The Nuremberg Code only came back into prominence in the early 1960s, following the exposure of ethically problematic research by people like Henry Beecher (1966) in the USA and Maurice Pappworth (1962) in the UK. It seemed that medical researchers outside Germany had concluded that business could continue more or less as usual. If Nazi medical science had been constructed as an outlier, then the Code could not apply to them. The Code also acquired significance from the attempts to develop a professional community of bioethicists (De Vries et al. 2009).

### The Lessons of Nuremberg

The implications of the Nuremberg Doctors Trial and the Nuremberg Code for research ethics are, then, more complex than they are often made to appear. Neither informal professional control nor administrative regulation had been successful in restraining the abuse of patients in medical experiments before 1939. Professional values were insufficient without disciplinary sanctions, but administrative regulation could not succeed in conflict with professional values. Like many of the subsequent regulatory structures, the Code was developed in haste to solve an immediate problem rather than as the result of a considered public debate about how the interests of science, society, trial participants, and ultimate beneficiaries should be balanced. It strongly reflected US assumptions about individual consent in ways that have not been helpful to much public health research, let alone social science research, that does not pose the same risks of pain, death, or permanent disability. Nevertheless, it has become a conservative trump card to be played in any debate about the appropriateness of ethics regulation in relation to any area of scientific, or even social scientific, research.

## Research Integrity and Research Misconduct

Mark Israel  
Australasian Human Research Ethics  
Consultancy Services, Perth, Australia

## Synonyms

Ethical research; Responsible conduct of research

## Introduction

Researchers should be able to rely on the integrity of their colleagues and their honesty in the description of their methodology, in recording

their analysis, and in reporting their findings. Those who apply or use research outcomes must be able to trust local, national, and global research processes so that scholarship can become a cumulative exercise. And yet scientists face mounting commercial and institutional pressures to gain grants and publish, a climate in which they may be tempted to engage in unacceptable behavior. The research misconduct that ensues can be very harmful for scholarship as well as for individuals and society.

## What Is Research Integrity?

Definitions of integrity vary across countries, institutions, and disciplines. The choice can reflect whether emphasis is placed on detection and punishment or on education and culture. The dominant position in many jurisdictions dwells on misconduct; where the definition has legal status and is meant to hold researchers and institutions accountable, the acts and degree of intention associated with misconduct may be tightly demarcated. In 2000, for example, the United States Office of Science and Technology Policy published the Federal Policy on Research Misconduct. The policy defined research misconduct tightly in terms of fabrication, falsification, and plagiarism. *Fabrication* is “making up data or results and recording or reporting them.” *Falsification* is “manipulating research materials, equipment, or processes, or changing or omitting data or results such that the research is not accurately represented in the research record.” *Plagiarism* is the “appropriation of another person’s ideas, processes, results, or words without giving appropriate credit.” The threefold definition of misconduct as fabrication, falsification, and plagiarism has become part of research codes in many parts of the world.

On the other hand, where definitions are intended to promote broader research or social values, the field may be conceived quite broadly. Some national codes and guidelines describe their remit in positive tones and emphasize integrity and the concepts of honesty, carefulness, independence, and fair recognition. In 2010, the Second

World Conference on Research Integrity produced *The Singapore Statement on Research Integrity* as a guide for future regulations. The authors of the Statement argued that it contained fundamental principles relating to honesty, accountability, professional courtesy and fairness, and good stewardship of research, as well as 14 professional responsibilities that together ought to transcend legitimate national and disciplinary differences. Many codes and statements developed outside the United States have also extended their definition of research misconduct well beyond fabrication, falsification, and plagiarism to include other matters such as undisclosed duplicate publication; misrepresentation of data, interests, qualifications, and involvement in authorship; mismanagement of data; breaches of duties of care including improper conduct in peer review; unethically interfering with other people's research; and poor institutional policies, procedures, and practices to foster research integrity and improper responses to allegations of misconduct, including retaliation against whistleblowers. This extended range of issues is sometimes termed "questionable" or, more accurately, "detrimental" research practices.

Excessive focus on fabrication, falsification, and plagiarism can miss some disturbing practices that are widespread. For example, psychologists and management researchers have identified detrimental practices in data analysis and reporting. In those fields, growing use of data-mining and more sophisticated statistical packages may mean that more confidence is placed on apparently positive results than might be warranted. Some researchers capitalize on chance variations in datasets by presenting post hoc hypotheses as if they were a priori (HARKing or Hypothesizing After the Results are Known). Chance variations can be further manipulated to produce a result that appears to be statistically significant by *p*-hacking, converting a particular measure of significance to a target, excluding outliers, using covariates, and only reporting conditions that achieve that target (the 'file drawer' problem).

Tensions have also arisen over the attribution of **authorship**. Researchers face enormous pressures to publish or, at least, look like they are

publishing. Quantity may take precedence over quality in publication. Different disciplines maintain incompatible conventions and different countries face distinct pressures to determine authorship in particular ways. Health researchers have had long-standing concerns that the names that appear at the top of an article in their field do not reflect the true authorship, either because someone who has insignificant involvement has been added – gift, honorary, or prestige authorship – or because junior staff who made significant contributions have been omitted – ghost authorship. A particularly pernicious abuse of authorship conventions involved pharmaceutical companies financing and ghostwriting articles supporting their products and then laundering these results through compliant gift authors. The International Committee of Medical Journal Editors updated its *Recommendations for the Conduct, Reporting, Editing, and Publication of Scholarly Work in Medical Journals* in 2016. This recommended four conditions be met before someone be named as an author (s.II.2): (1) substantial contributions to the conception or design of the work, or the acquisition, analysis, or interpretation of data for the work; (2) drafting the work or revising it critically for important intellectual content; (3) final approval of the version to be published; and (4) agreement to be accountable for all aspects of the work in ensuring that questions related to the accuracy or integrity of any part of the work are appropriately investigated and resolved. There is far from universal agreement that all four criteria should be met. Indeed, a strict interpretation of these criteria might preclude interdisciplinary and international collaboration as each author may not be able to understand the methodologies or languages used by their colleagues to collect and analyze data.

### The Extent of Research Misconduct

Commentators have been divided on the extent of research misconduct as well as whether the problem is growing. One 2017 report by the National Academies of Sciences, Engineering, and Medicine described the likely incidence as "unusual" but not "rare" and costing the United States between hundreds of millions and several billion

dollars annually. Certainly, there have been significant increases in the number of journal articles being retracted, high levels of failures to replicate research results in particular fields such as social psychology and preclinical biomedicine, and predatory journals who charge authors to publish but fail to provide appropriate peer review. Meta-analysis of self-report studies of researchers found 2% of researchers admitted to fabricating or falsifying data at least once and over 14% were aware that their colleagues had done so (Fanelli 2009). In the United States, the Office of Research Integrity considers allegations of misconduct in publicly funded biomedical research. Between 2006 and 2015, ORI completed 329 cases, reaching findings of misconduct in 125 cases. In 119 of these cases, the matter involved falsification and/or fabrication. On the other hand, the Office of the Inspector General at the National Science Foundation in the United States dealt with a growing number of plagiarism cases. Of course, increased reporting does not necessarily mean more misconduct. It *may* reflect more positive trends – misconduct is being identified, and universities and research institutes have installed procedures to respond to misbehavior.

### Understanding Causation

Institutional or national codes rarely rest on an analysis of the reasons why people might breach norms of research integrity. Indeed, systematic research into the causes of scientific misconduct is scarce. However, occasionally, committees of investigation and research organizations have offered some comment. Some see the researcher as a “bad apple.” A researcher’s own ambition, vanity, desire for recognition and fame, and the prospect for personal gain may lead to behavior that crosses the limits of what is admissible. Much policy is based on an assumption that if individual wrongdoers can be weeded out, the problem of research misconduct will diminish. However, others point to the culture that may prevail in certain disciplines or research groups (“bad barrel”). Again, others identify the creation of a research environment overwhelmed by corrupting pressures (“bad barrel maker”). Many academics are under increasing pressure to publish – and to

do so in English irrespective of their competence in that language – as their nation or institution seeks to establish or defend its placing in international research rankings. So, individuals are forced to meet publication and citation targets in order to obtain jobs, grants, research contracts, or sponsorship. In response, research institutions are expected to create and sustain a research culture that fosters and monitors integrity and effectively investigate and address research misconduct. Finally, others attribute misconduct partly to weak and ineffective oversight regimes (“bad apple checker” and “bad barrel checker”).

Most countries have no independent oversight of research integrity. A review of international practice (Hickling Arthurs Low 2009) distinguished between three kinds of national regulatory systems. The first type had a narrow legal definition of integrity and a central regulatory agency with powers of investigation – in the United States, policy development has followed legislative requirements and has been accompanied by mandatory training and compliance regimes. However, few countries have followed the United States model. Instead, the review found that many countries, including most low- and middle-income countries, had neither national legislation nor independent oversight, and responsibility was at best diffuse and at worst ambiguous. A third category (countries such as Australia, Canada, Germany, the Netherlands, the United Kingdom and Sweden) also had no national legislation, but by placing integrity within broader and more constructive discourses of honesty and fairness, research councils and university peak bodies had created codes or model guidelines and/or had devolved responsibility to research institutions to develop their own policies as a condition of funding; in some cases, advice on investigation could be provided by an independent body. By 2015, more than half of the 40 leading research nations had national policies relating to research integrity, while many other countries were in the process of developing them.

Some national approaches place a responsibility on research institutions to provide **education** programs for their researchers. There is little evidence that online programs designed to meet

compliance requirements have any impact on research integrity. Programs that aim at developing the skills and attributes associated with ethical decision-making in real situations may be more productive (National Academies of Sciences, Engineering, and Medicine 2017), particularly if they can promote discussion of integrity in the actual research environment.

Another approach to promoting research integrity has involved identifying, sharing, and in some cases codifying **better practices** around mentoring, data and code sharing, and transparency in reporting. Many codes seek to clarify the responsibilities of researchers, their institutions and partners, and funding agencies. They also want to ensure that standards and responsibilities to be easily communicated (if not agreed) across jurisdictions, cultures, and disciplines. In doing so, several organizations have shifted attention from individual wrongdoing to collective practices. For example, from its inception, the Global Research Council (2012), an alliance of national funding agencies, acknowledged the importance that funders must play in establishing an international environment within which integrity is at the heart of the research enterprise. Reports of discussion at the four World Conferences on Research Integrity have also revealed this shift in emphasis.

## Synonyms

Gas and Mineral Extraction; Oil

## Introduction

Resource extraction refers to the removal from the earth of nonrenewable substances that include metals, nonmetallic minerals, construction aggregates, and hydrocarbons. As businesses, resource extraction refers to the oil, gas, and mining industries. Companies engaged in resource extraction range from relatively small enterprises devoted to mineral exploration with a total capitalization of a few million dollars or less, to multinational oil, gas, and mining corporations capitalized in multiple billions of dollars whose activities span

---

Wes Cragg: deceased.

exploration, project development, resource production, and down-stream processing.

Resource extraction is a distinctive form of industrial activity that gives rise to a number of specific issues in business ethics, which can be briefly summarized as follows:

### **Stewardship of Mineral Resources**

Mineral resources constitute a natural endowment of the jurisdiction in which they occur, and in the first instance are collectively owned by the citizens of that jurisdiction. The fact that mineral resources are nonrenewable, such that once extracted their value is no longer available to society, would appear to impose a unique stewardship responsibility on the governing authorities and the companies involved to ensure that resource extraction contributes to the long-term benefit of the host jurisdiction. However, in fact, resource extraction has very often been accompanied by the squandering of the potential benefits to society owing to the absence of responsible and effective governance, or in other words the absence of good stewardship of the resources. The pattern of deteriorating economic, social, environmental, and political conditions in many countries with a high level of dependence on resource extraction is commonly referred to as the “resource curse.” At the core of the interaction between resource extraction and the jurisdiction that owns the resources are ethical issues of procedural justice, relating to how decisions about resource extraction should be made, and distributive justice, relating to who should receive what share of the benefits (primarily a contest among capital investors, governments, local communities, corporate management, and unionized employees).

Over the centuries, governments have commonly allowed resources to be extracted through private sector investments that are propelled by the prospect of individual or corporate enrichment. The rationale for this free enterprise approach is that resource extraction involves considerable financial and technical risks that are best relegated to the extractor, while the governing jurisdiction should be content to capture spin-off benefits through taxation, employment, and infrastructure development. However, there have also

been many cases over the centuries in which governments have nationalized mineral resources and allowed extraction to be done only by state-owned enterprises. The rationale is that the host jurisdiction, as owners of the resource endowment, should capture all the benefits available from extraction. Historically, the extent to which the potential benefits have been fully realized from nationalized resources has often in practice been constrained by a low level of government efficiency both in extracting the resource and in utilizing the revenue from it.

Neither total free enterprise nor total state control appears from experience to be consistent with or even indicative of an ideal norm of ethical stewardship of nonrenewable resources. The on-going challenge for business ethicists is to identify reasonable and credible criteria for such ethical stewardship and practical approaches for achieving it.

### **Environmental Responsibility**

Resource extraction generally involves a significant disturbance of an area of the earth’s surface. This is particularly the case with open pit mines, which can be as much as several kilometers in diameter and over a kilometer in depth. Both open pit and underground mining also generate and require the storage of massive amounts of waste rock and mine tailings. These facets of mining together create new and permanent changes to the natural environment. Significant surface disturbances are also caused by large oil-fields that have many wells and extensive connecting infrastructure. One major environmental issue of all forms of resource extraction relates to the impacts on quality and quantity of water in the local area, because of both the often massive utilization of fresh water in resource processing and the massive discharge of often polluted effluent afterwards. Another major environmental impact of resource extraction, particularly of hydrocarbons, relates to atmospheric pollution, especially the emission of greenhouse gases. Overall, a significant cost of resource extraction relates to controlling and reducing the negative aquatic and atmospheric impacts, granting that their total

elimination is generally technically and economically unfeasible.

One core ethical issue concerns the distribution of costs and risks of actual or potential environmental impacts between the resource extractor and the general public, either the entire citizenry of the governing jurisdiction or specific local communities. Another core ethical issue relates to the ultimate justification for resource extraction, which includes an analysis of the overall costs versus the overall benefits to society, including the positive or negative impacts on future generations.

For the sake of preserving profit margins, resource extractors are naturally reluctant to internalize the totality of costs represented by “negative environmental externalities.” The challenge for business ethicists is to identify reasonable, credible, and pragmatic principles and criteria for identifying, assessing, and quantifying (where feasible) the environmental externalities of resource extraction and discerning the norms for an equitable distribution of the burden of costs and risks if such a distribution is appropriate.

## Social Responsibility

### Social License to Operate

Unlike other businesses, the resource extraction industries are constrained by where extractable deposits of resources are found with respect to where they can locate production facilities. Often the communities that exist in areas where resources are located are remote from metropolitan centers, are subject to extreme poverty and in some cases violent conflict, and receive little attention or support from their governments. However, in the era of globalized communications through the Internet, such remote communities are not entirely isolated, and the existence of a resource extraction project in their vicinity can be a catalyst for attracting the attention of organizations around the world that are concerned about poverty alleviation, social justice, human rights, community empowerment and in many cases are particularly concerned about the often problematic environmental and social performance of oil, gas, and mining companies. Most resource

extraction companies recognize the need to respond constructively to the social and economic conditions that they encounter around their operations, understanding that the failure to do so could generate local and global opposition, possibly to the extent of interrupting production.

The concept of a “social license to operate” is commonly used to describe the existence of a constructive relationship between a resource extractor and local communities. The mining industry has also adopted a global strategy of “sustainable development” through the International Council of Mining and Metals (ICMM), which provides guidance to companies in contributing to economic and social improvements in the areas around mines that will endure after the resource is depleted and the mines are closed. However, it is increasingly recognized that resource extraction can contribute effectively to sustainable development only if host jurisdiction governments and the local communities themselves have the capacity and the orientation and will required to collaborate with resource extractors in achieving durable economic and social improvements. The challenge for business ethicists is to provide insights into the underlying norms and values that can augment the capacity of companies, governments, and communities to adopt shared developmental objectives and to work in alignment to achieve them.

### Indigenous Peoples

Indigenous peoples present a set of issues to resource extraction that go beyond the sphere of concerns related to the conventional relationships between resource extractors and local communities. The claim by indigenous communities to large areas of “traditional territory,” on which their culture, livelihood, and future existence is dependent, frequently gives rise to conflicts with oil, gas, or mining companies that have an interest in extracting resources on those lands. In recent decades this has been a subject of growing global concern on the part of governments, resource extraction industries, and the indigenous peoples themselves, who have been organizing ever more effectively to promote and secure their rights. In 1989, the International Labour Organization

(ILO) adopted Convention 169 on “Indigenous and Tribal Peoples,” which has been ratified into national law by 22 countries, mostly in Latin America. This convention declares that indigenous peoples possess certain rights related to the use, management, and conservation of resources on their traditional territories and that governments are obligated to consult with indigenous peoples to ensure that their interests are recognized and protected before approving resource extraction proposals on their traditional territories. In practice governments have failed to engage in effective consultation, which has been a source of conflict around certain resource extraction projects. As a consequence, resource extraction companies have unofficially acquired the burden of consultation, which some but not all companies have taken very seriously.

In 2007, the United Nations adopted the “Declaration on the Rights of Indigenous Peoples,” which does not have the force of law in most signatory countries but carries significant moral force. The most significant norm stated in the UNDRIP is that indigenous peoples have the right to “free, prior and informed consent” before resource extraction can take place on their traditional territories. In Canada, the “Constitution Act (1982)” recognizes and affirms the rights of aboriginal peoples, which includes First Nations, Metis, and Inuit, but does not define those rights. A succession of decisions by the Supreme Court of Canada has contributed to the clarification of the rights and entitlements of Canadian indigenous communities, particularly with respect to the government’s duty to “consult and accommodate” First Nations, Metis, and Inuit, before government approval of resource extraction projects on their traditional territories. In practice, resource extractors have taken on much of the duty to consult indigenous communities in Canada about the potential impacts and benefits of proposed projects, generally resulting in contractual relationships between companies and communities, which are usually referred to as “Impact Benefit Agreements” or “Participation Agreements.” Globally, the challenge for business ethicists is to identify the norms and values required for successful interactions between resource

extractors, indigenous communities, and governments, with particular attention to the question of what constitutes “free, prior, and informed consent.”

### Bribery and Corruption

Transactions between resource extraction companies and governments are particularly susceptible to bribery and corruption because of the intense competition among oil, gas, and mining companies to acquire access to resources and to obtain developmental permits, both of which require the approval of public officials who may be inclined to seek a personal share of the very large amounts of capital at stake in their decisions. Preventing bribery and corruption in transactions between resource extractors and governments has become a matter of: legislation by the home country governments of resource extraction companies; collective voluntary initiatives by certain governments, companies and civil society organizations; and corporate policies and programs by individual companies.

For many years the US “Foreign Corrupt Practices Act (1977/1988)” was the only legislation in force that criminalized the payment of bribes by resource extractors to foreign government officials. However, in 1997 member countries of the OECD adopted the “Convention on Combatting Bribery of Foreign Public Officials in International Business Transactions.” Since then all OECD member governments have implemented legislation in accordance with the OECD Convention. In Canada, for example, international resource extraction companies that are headquartered in Canada are subject to the Canadian “Corruption of Foreign Public Officials Act (1999).” In 2013, member countries of the G-8 made a commitment to implement common global reporting standards for resource extraction industries concerning payments to host country governments. In Canada, this commitment was enacted into legislation with the “Extractive Sector Transparency Measures Act (2015).” Comparable disclosure requirements have been implemented in the USA by the Dodd Frank Act and in the European Union by the Accounting and Transparency Directives.

The oldest voluntary initiative of concerned companies, governments, and other organizations to combat corruption is Transparency International, which was founded in 1993. TI now has over a 100 chapters in different countries dedicated to fighting corruption in their home jurisdictions, and TI produces the most authoritative annual global surveys of corruption, which have frequently highlighted concerns related to resource extraction. Another voluntary initiative, Publish What You Pay, founded in 2002, is a coalition of civil society organizations with chapters in 40 countries, whose particular focus is on eliminating corruption as the principal cause of the “resource curse.” Another voluntary initiative the Extractive Industries Transparency Initiative (EITI) is a coalition of governments, companies, and civil society organizations, which was launched in 2002 at the Johannesburg Earth Summit under the leadership of the UK with the objective of implementing a common standard for reporting of payments and receipts of resource extraction revenues by companies to governments.

A number of resource extraction companies have implemented corporate policies and strategies to prevent bribery and corruption of public officials by their company personnel. Generally, these policies and strategies, sometimes referred to as “corporate integrity systems,” include guidelines for employees on correct conduct in transactions with government officials and disciplinary measures for noncompliance, along with provisions to protect whistle-blowing. The challenge for business ethicists is to evaluate the effectiveness of governmental, collective voluntary, and individual corporate initiatives to combat bribery and corruption, and provide insights into understanding and inculcating the required norms and values.

## Resource Extraction and Indigenous Community Consent

Ginger Gibson<sup>1</sup> and Ben Bradshaw<sup>2</sup>

<sup>1</sup>The Firelight Group, Edmonton, AB, Canada

<sup>2</sup>Department of Geography, University of Guelph, Guelph, ON, Canada

## Synonyms

Free, prior and informed consent (FPIC)

## Introduction

In those increasingly common instances where a private firm seeks to extract resources such as minerals or oil from a territory to which an Indigenous community has established ties, Indigenous communities, supported by civil society organizations and responsible investors, have called upon these firms to secure their *free, prior and informed*

consent (FPIC). Although recognized through international normative obligations, the right of FPIC is not wholly recognized nor supported in law in many jurisdictions.<sup>1</sup> This entry serves to outline the FPIC concept, highlighting its origins and the ways in which some governments and the private sector have responded to its invocation. We conclude by arguing that the growing acknowledgment of FPIC can serve to bring greater certainty to the sector and ultimately greater harmony to heretofore strained relations.

### FPIC's Meaning and Origins

FPIC is commonly used as a short-hand expression to describe the right of Indigenous people to offer or withhold consent to developments that may have an impact on their territories or resources. To be true to its definition, free, prior and informed consent must be obtained without force, coercion, intimidation, manipulation, or pressure from the government or company seeking consent (**free**); with sufficient time to review and consider all relevant factors, starting at the inception stage, in advance of any authorization for, and continuously throughout the planning and implementation of activities (**prior**); based on an understanding of adequate, complete, understandable, and relevant information relative to the full range of issues and potential impacts that may arise from the activity or decision (**informed**); and can be given only by the legitimate representatives of the people affected, with any caveats or conditions stipulated by the people whose consent is given (**consent**). It must be noted that FPIC cannot exist where a people do not have the option to meaningfully withhold their consent.

First formally introduced in the 1989 *International Labour Organisation's Convention on Indigenous and Tribal Peoples in Independent*

*Countries*, FPIC was originally defined as a requirement that consent must be acquired before Indigenous communities are relocated or before development is undertaken on their land. FPIC became a more commonly cited concept after substantial mobilization by Indigenous people at the United Nations (UN) General Assembly, after which there was recognition in the preamble that control over development “will enable (Indigenous peoples) to maintain and strengthen their institutions, cultures and traditions and to promote their development in accordance with their aspirations and needs” (United Nations 2007, 2). Thereafter, there is recognition in several articles of the 2007 *United Nations Declaration on the Rights of Indigenous Peoples* (UNDRIP), which broaden the scope of situations in which FPIC should be sought as a best practice, specifically in negotiations regarding land, culture, property, resources, and conservation.

With respect to development on their traditional lands, Article 32 states: “1) Indigenous peoples have the right to determine and develop priorities and strategies for the development or use of their lands or territories and other resources; 2) States shall consult and cooperate in good faith with the indigenous peoples concerned through their own representative institutions in order to obtain their free and informed consent prior to the approval of any project affecting their lands or territories and other resources, particularly in connection with the development, utilization or exploitation of mineral, water or other resources; and 3) States shall provide effective mechanisms for just and fair redress for any such activities, and appropriate measures shall be taken to mitigate adverse environmental, economic, social, cultural or spiritual impact.”

Since 2007, the UNDRIP has been championed by the UN's Indigenous Peoples Working Group, whom now are collectively seeking formal recognition and a seat at the United Nations. The Declaration has also been championed and affirmed by Indigenous peoples globally, in policies and statements to national governments.

This championing of FPIC by Indigenous peoples and its growing recognition in legal terms belies its historical, spiritual origins. The concept

<sup>1</sup>For example, outside of areas covered by modern land claims (e.g., Nunavut) or court settlements (e.g., Tsilhqot'in), Canadian law requires the Crown to consult indigenous populations in advance of any development and seek to accommodate concerns involving infringement of rights, which is a lesser standard to FPIC.

of FPIC is grounded in, and recognizes, the intimate relationship that exists between Indigenous peoples and the land. This sacred and special relationship is one component of Indigenous culture, in which the land is a part of personal and community identity (Firelight Group 2017). Rose (1996, 7) offers a description of this particular relationship in the context of Australian aborigines:

People talk about country in the same way they would talk about a person: they speak to country, sing to country, visit country, worry about country, feel sorry for country, and long for country. People say that country knows, hears, smells, takes notice, takes care, is sorry or happy . . . country is a living entity with a yesterday, today and tomorrow, with a consciousness, and a will towards life. Because of this richness, country is home, and peace; nourishment for body, mind and spirit; heart's ease.

The term “country” here encompasses the unity of land, sea, sites, knowledge, law, culture, and people (O’Faircheallaigh 2008). The meaning of the land to Indigenous people transcends the physical to include the spiritual and cultural. The principles underlying FPIC allow for continued interrupted stewardship over their lands by Indigenous peoples. This stewardship has been harshly interrupted by colonial and settler governments.

## Acknowledgment of FPIC

With respect to state acknowledgment of FPIC, the UNDRIP has been significant. Indeed, the Declaration represents the most comprehensive international tool regarding the rights of Indigenous peoples and provides a framework that sets standards for all states to follow. It also provides aspirational statements that member countries are encouraged to follow and implement. As of June 2017, only Azerbaijan, Bangladesh, Bhutan, Burundi, Georgia, Kenya, Nigeria, and the Russian Federation had yet to endorse the Declaration. Canada, Ukraine, and the United States were among the last countries to implement the Declaration.

In the case of Canada, its implementation has arguably been more impactful politically than legally. A Liberal federal government elected in

2015 publicly declared its desire to reconcile the Crown’s relationship with Indigenous populations and endorsed all of the recommendations of the 2015 Truth and Reconciliation Commission, one of which calls on the private sector to obtain the free, prior and informed consent of Indigenous peoples before proceeding with a project on those peoples’ traditional territories. However, current legal requirements in most Canadian jurisdictions, built on legal precedent set by the Supreme Court of Canada (*Haida Nation V. BC* 2004; *Taku River Tlingit First Nation V. BC* 2004), necessitate Indigenous community consultation and accommodation.

With respect to private sector recognition, the inclusion of FPIC in a key Performance Standard set by the International Finance Corporation (2012), the private sector lending arm of the World Bank, has undoubtedly been impactful.<sup>2</sup> Consistent with this, some individual firms in the resource extraction sector have committed to securing the consent of Indigenous peoples from whose lands they seek to extract resources. More universally, several key industry organizations with influence in the extractive sector have developed guidelines that are promoting the application of FPIC principles. Though each industry has approached the FPIC issue discretely (forestry from mining, from oil and gas), the guidebooks, principles, and guidelines are roughly aligned and similar in their process focus.

For example, in their May 2013 Indigenous Peoples and Mining Position Statement, the International Council of Metals and Mining (ICMM) committed their members to: engage Indigenous communities in project decision-making in a way that is consistent with traditional decision-making processes, and acquire the free, prior and informed consent of Indigenous peoples where

<sup>2</sup> IFC Performance Standard #7, which came into effect in January 2012, requires clients to secure FPIC where a project is located on lands traditionally owned by, or under the customary use of, Indigenous Peoples, and adverse impacts can be expected. This is absolutely required in the case of relocation, and where significant project impacts on critical cultural heritage are unavoidable (IFC).

mining projects are to be located on traditional owned lands or where traditional practices occur (ICMM 2013).

At a national level, industry associations have grappled with the FPIC concept. For example, the Mining Association of Canada (MAC) has issued a protocol providing guidance on meaningful dialogue with communities, requiring companies to self-report on “community of interest identification,” engagement and dialogue, response mechanisms, and reporting. The Prospectors and Developers Association of Canada (PDAC) has prepared guidance documents on Aboriginal engagement and on the Duty to Consult, but these do not require consent. PDAC provides both a guide and a trainer’s manual for exploration companies. Finally, the Canadian Association of Petroleum Producers (CAPP) notes that the duty to consult and accommodate Aboriginal peoples lies with the Crown and that ultimately this duty cannot be delegated. CAPP has published a document that provides guidance for industry proponents to take action to reduce the risk of legal challenges on the basis of a failure to consult.

With the commitment by the current Canadian federal government to reconciliation, there is a strong expectation that the Canadian landscape and legal requirements will be revised and that corporate practice and commitment will also shift.

Given that some firms are prepared to operate at a standard that exceeds regulatory requirements and their industry associations, it is encouraging that civil society organizations have come to develop certification systems that allow differentiation within markets that recognize environmental and social performance (Cashore 2002). While the Forest Stewardship Council (FSC) and Marine Stewardship Council (MSC) certification systems have garnered the most attention, the resource extraction sector has become also a focus of certification through the Initiative for Responsible Mining Assurance (IRMA). Significantly, IRMA includes a standard focused on FPIC, which, for a mine to acquire certification, requires that the mine developer:

- Has a publically available policy that includes a statement of the company’s respect for Indigenous rights
- Completes a due diligence assessment to ensure adequate consultation by the host government in obtaining mineral access for exploration
- Not undertake any mining-related activities that may impact Indigenous peoples prior to obtaining their free, prior and informed consent
- Not seek to engage in FPIC-related discussions unless the would-be impacted Indigenous peoples communicate that they wish to do so (IRMA 2017)

Under the IRMA Standard, existing mines for which FPIC was not obtained will be expected to demonstrate adherence to the Standard through operational efforts. One potential means for displaying adherence may be the presence of an Impact and Benefit Agreement (IBA) signed by the mine developer and regional Indigenous communities. Common to Canada, Australia, and, most recently, Greenland, an IBA serves to complement regulatory systems by offering enhanced impact mitigation and tangible benefits to communities in exchange for their acceptance of a project (Galbraith et al. 2007). IBAs can provide benefits to Indigenous communities such as payments, training and employment, and preferential treatment of community businesses; less routinely, IBAs offer a means for would-be impacted communities to influence project design and operation (Gibson and O’Faircheallaigh 2010). For example, as a condition of their support for Inco’s Voisey’s Bay nickel mine, the Labrador Inuit Association secured limits on winter shipping to and from the mine in order to protect winter ice travel by Inuit hunters. Given this latter possibility, some IBA signatories and scholars have identified an IBA as an expression of consent (e.g., Sosa 2011; Boreal Leadership Council 2012, 2015; Bradshaw and McElroy 2014), though all recognize that ensuring that an agreement is reached free of coercion and with complete information is a challenge (Papillon and Rodon 2015).

## Making the FPIC Standard Work

The emergence of FPIC in the resource extraction sector over the past few decades has undoubtedly generated concern among would-be developers of oil fields and mines. This concern may be misplaced. Though the transition will be challenging for the resource extraction sector and its investors, the acknowledgment of FPIC will bring greater certainty to the sector and ultimately greater harmony to government- and company-community relations (Boreal Leadership Council 2012, 2015). To get there, industry and the Crown have to work to support the aspirations and capacity of Indigenous communities to exercise their right of consent. Indigenous communities have work to do, as they recover from decades of resource extraction that has occurred without their consent. Many are preparing FPIC approaches by developing resource extraction policies, which present the precise terms under which communities will manage requests by firms to explore within their traditional territories, engage in dialogue about development possibilities, and perhaps offer support for a particular development plan (BLC 2012). One of the earliest policy statements was developed by the Tahltan Tribal Council in British Columbia in 1987. Rather than react in an ad hoc way to development pressures, the Tahltan reflected on their mining-related concerns and expectations and formulated a policy statement that enabled them to exercise authority.

Unquestionably FPIC poses governance challenges for those who seek its embrace. For example, what is the best expression of a community's free and informed consent? Does a community-ratified agreement (e.g., IBA) meet the bar? If so, what happens if the community later determines that the mechanism of community decision-making failed to reflect traditional governance, or that they were ill-informed or lacked the freedom to make a good decision? Must consent be repeatedly secured through the lifespan of an operation, and, if so, what does this mean for firm's access to capital? Does the standard of FPIC change if the Indigenous community becomes an invested partner in the operation?

Though these challenging questions remain, the option of pursuing resource extraction without Indigenous community consent no longer exists.

University of Ottawa, Ottawa, ON, Canada

### Synonyms

Human Rights; Indigenous peoples; Inter-American Human Rights System; Latin America; Resource extraction

### Introduction

Latin America relies on the exploitation of natural resources to support its development. This is not

new, as resource extraction has driven economic policies in Latin America throughout its history. The problem is that these measures are usually adopted at the expense of people living in areas where these resources are located. Indigenous Peoples, rural communities, and Afro-descendants are some of the groups that tend to clash with the state and security forces on issues related to ownership of the land, access to natural resources, or the protection of the environment.

The purpose of this entry in the Encyclopedia of Business and Professional Ethics is to describe what have been the main impacts on human rights related to extractive industries in Latin America and to recount how affected groups have used courts to protect their rights.

## Main Impacts of Extractive Industries on Human Rights

It is undeniable the importance of extractive industries for the economic and social policies of Latin American countries. Between 2015 and 2017, it was estimated that copper, iron and steel, and other precious metals accounted for 77% of the exports of the region, including the Caribbean (ECLAC 2018). The exploitation of metallic and nonmetallic minerals has increased six times between 1970 and 2017, significantly affecting the environment (ECLAC 2018). Much of the legal and institutional reforms implemented in the past 30 years, which include the adoption of free trade agreements and foreign investment treaties, focus on providing legal, fiscal, and financial stability to attract multinational corporations.

The problem is that these laws tend to minimize or ignore the impact on the human rights of vulnerable groups or the environment. For example, the 2008 Ecuadorean Constitution establishes the preservation of biological reserves, unless the government declares the exploitation of extractive resources in that biological reserve as a matter of national interest. Another case is when governments amend laws that simplify how businesses can apply and obtain mining permits. This usually means that environmental regulations are

softened – including loosening requirements regarding the content of environmental impact assessments – or that the independence of environmental regulatory agencies is compromised. Colombia, Mexico, and Peru are recent examples of this practice.

In other cases, states adopt laws that criminalize the right to protest or the right to peaceful assembly as a means to threaten opposition to extractive projects. For example, in 2014, an international human rights court found that in Chile, the anti-terrorist legislation was disproportionately used against Mapuche Indigenous groups protecting their territory. In Honduras, since 2018, eight leaders from the Guapinol community have been held in pretrial detention due to their opposition to a mining project that would pollute the river and their land.

The situations described above are not exceptions. Latin America is the most dangerous place for human rights and environmental defenders. For example, Front Line Defenders estimated that 264 defenders were killed in the Americas in 2019 (FLD 2020). These attacks were mostly against Indigenous and environmental leaders. Due to the remoteness of the areas where some of these defenders work, it is probable that this number is significantly higher. But not only human rights defenders are attacked or killed for doing their work but most of these crimes remain unpunished. For example, the assassination of Honduran Indigenous environmental leader Berta Cáceres in 2016 got worldwide attention. Yet, to this date, nobody has been convicted for this crime. In cases like Colombia or Mexico, some communities opposing extractive projects are forced to leave their homes due to the threats and attacks on their lives.

These examples show how the policies designed to attract resource extraction in Latin America affect human rights and the environment. In part, this impact is caused by deficient regulations and the inability of states to promote sustainable development policies that includes affected groups (Rodríguez-Garavito 2011). By undermining human rights duties – like the right to consultation of Indigenous Peoples, the right to peaceful protest

or the right to water –, states actually create these socio-environmental conflicts.

## Protection of Human Rights Through Courts

In Latin America, human rights are recognized in the Constitution and most of these countries have specialized Ministries or offices to promote the exercise and fulfillment of these rights. Additionally, Latin American countries have ratified the majority of international human rights treaties. Despite this legal and institutional framework, there are always exceptions or loopholes that allow the state to prioritize extractive projects, usually at the expense of vulnerable groups.

Because laws fail to effectively guarantee these rights, groups affected by extractive industries bring their claims to courts. The response by national courts has been inconsistent at best (Quintana and Flores 2017). Let's take for example the case of land titling. States tend to recognize the ancestral presence of Indigenous Peoples in a specific territory. But without a property title, there is uncertainty to the exact extension of the land, and businesses might challenge the existence of Indigenous land in order to get a mining permit. In these cases, courts recognize the existence of the territory but leave it at the discretion of the Executive how to grant these property titles, leaving Indigenous Peoples unprotected.

For that reason, groups opposing state permits allowing extractive industries to operate in Indigenous land prefer to bring a case to international forum like the Inter-American Human Rights System (IAHRS). This regional body has been fundamental to determine the human rights obligations of states applicable to extractive industries (Shelton 2013).

## The Inter-American Human Rights System Case Law on Indigenous Peoples and Extractive Industries

The IAHRS is a regional system created by the Organization of American States (OAS) to protect

human rights. The IAHRs has two main bodies: the Inter-American Commission on Human Rights, created by the OAS in 1959, and the Inter-American Court of Human Rights (IACtHR), created by the American Convention on Human Rights (ACHR) in 1969.

The ACHR is the governing body of the IAHRs. This treaty entered into force in July 1978 with the purpose of promoting the protection of civil and political rights and to assess state behavior. The decisions of the IACtHR are binding and final upon its 20 state parties. In more than 40 years of existence, the IACtHR has adopted over 25 decisions related to extractive industries, mostly in cases related to mining companies operating in Indigenous territory.

The IACtHR has used the ILO Indigenous and Tribal Peoples Convention of 1989 and the 2007 UN Declaration on the Rights of Indigenous Peoples, to create a judicial framework under the ACHR to protect Indigenous rights. The judicial standards set by the case law of the IACtHR have fostered legal and institutional change in the states that are parties to the ACHR. These reforms include the adoption of specific laws regarding Indigenous rights (Peru), the creation of specialized governmental ministries or agencies on Indigenous rights (Colombia, Chile), as well as the implementation of national policies on Indigenous Peoples (Bolivia).

The IAHRs has acknowledged the historic discrimination that Indigenous Peoples face in Latin America (IACHR 2016). The case law of the IACtHR on the rights of Indigenous Peoples has addressed different types of violations to the ACHR, including situations of forced disappearances, sexual violence, the protection of their culture and traditions, among other rights. However, it is in cases concerning the rights to territory, consultation, and free, prior and informed consent that the IACtHR has made a broader impact in the field of Indigenous rights.

To create this judicial framework, first the IACtHR had to identify the relevant article to protect the aforementioned rights, as the ACHR does not establish specific obligations to protect Indigenous Peoples, other than a general section prohibiting discrimination on racial or ethnic

grounds. It wasn't until 2001 that there was a case related to the control and access to Indigenous land. In that year, the IACtHR published its decision on *Awás Tingni v. Nicaragua*. This case expanded the scope of Article 21 of the ACHR to include the right to collective property (IACtHR 2001). In retrospect, this article – originally adopted to protect individual property from expropriation – has become the right used by the IACtHR to protect the collective property, territory, culture, prior consultation, and consent of Indigenous Peoples.

As stated before, the ACHR does not have any reference to Indigenous rights, including consultation or consent. This topic was addressed in the 2007 decision of *Saramaka v. Suriname*. The importance of this decision has been paramount for Indigenous Peoples in Latin American countries and beyond. In *Saramaka*, the IACtHR set out the main elements of the right to consultation, including the obligations of the state to assure a free, prior, informed and culturally appropriate process (IACtHR 2007). In addition, the Court established that in large-scale development or investment projects, consent of Indigenous Peoples is required, due to the profound economic and social change that these projects cause.

Another contribution of the IACtHR to the rights of Indigenous Peoples is in the 2012 case of *Sarayaku v. Ecuador*. In this case, the Court ordered the state to remove the explosives that an oil company had laid in a mountain that was sacred to the *Sarayaku*. In this case, the IACtHR recognized that Indigenous Peoples are collective subjects under International Law, implying that they can enjoy some rights collectively (IACtHR 2012).

More recently, the IACtHR adopted in 2020 the decision on the *Lhaka Honhat v. Argentina* case. Although this case is not about extractive industries operating in Indigenous territory, it is relevant because the Court acknowledges Indigenous rights to healthy environment, food, water, and cultural identity (IACtHR 2020).

The decisions are important for extractive industries operating in Latin America for two reasons. Firstly, the case law of the IACtHR establishes the duties that states must fulfill before

granting a license for a company to operate on Indigenous land. If a mining permit is granted without proper consultation, national courts could overturn this permit by using the standards set by the IACtHR. This has happened in Colombia, Guatemala, Mexico, and Peru, just to name a few examples.

Secondly, businesses have a responsibility to respect human rights. The UN Guiding Principles on Business and Human Rights as well as the OECD Guidelines for Multinational Enterprises propose measures to minimize the adverse impact that businesses might have on local communities or the environment (IACHR 2020). Some of the measures recommended include human rights due diligence and access to reparations. In many cases, businesses from extractive sectors argue that they are bound by local legislation. Yet, the OECD Guidelines recommend that businesses should honor internationally recognized human rights. In Latin America, this includes the standards set by the IACtHR.

## Challenges for Extractive Industries and Human Rights

Groups affected by extractive industries have been successful at advocating for the protection of their rights before courts. The IAHRs has been instrumental to create a case law with standards that states must fulfill to assure that mining and oil and gas projects do not affect Indigenous Peoples, rural communities, or Afro-descendants.

There are two main challenges that will put these standards to test. First, in April 2021 the Escazú Agreement on Access to Information, Public Participation and Justice in Environmental Matters in Latin America and the Caribbean entered into force. This treaty establishes clear obligations on states regarding environmental matters. The focus of the treaty is for states to adopt laws and policies that will assure that environmental issues are freely accessible, underscoring the use of Indigenous knowledge to protect the environment. This treaty has currently 12 ratifications and there is no doubt that it will be used in cases regarding the

fulfillment of environmental regulations by extractive businesses.

The second challenge relates to a post-pandemic economic recovery. The International Monetary Fund estimates that in 2020, Latin American GDP contracted by 8.1% (IMF 2020). Governments will feel pressured to foster economic recovery, with extractive industries at the heart of this process. Although Latin America continues to face the impact of the pandemic, some governments are already planning how to rescue the economy. Most likely, these measures will include simplification of permits for extractive projects; adopt policies to attract foreign direct investments; and minimize environmental requirements like impact assessments. This will have an impact on human rights of vulnerable groups, and most likely, a new wave of public interest litigation will begin.

## Resource Extraction, Ethics, and Social Capital

Robert G. Boutilier  
Centre for Sustainable Development, Simon Fraser University, Vancouver, Canada

## Synonyms

Bonding Social Capital; Bridging Social Capital; Community Development; Community Empowerment; Economic Development; Poverty Reduction; Rural Development

Extractive industry projects have clear and visible impacts on the communities around them. Social justice websites highlight environmental damage

and displacements of residents while company sustainability reports focus on environmental rehabilitation and infrastructure projects like clinics, schools, and roads. However, beyond the partisan discourses, there are less visible impacts that actually make more of a difference for community development.

The World Bank sponsored programs and research on poverty reduction during the presidency of James Wolfensohn. A great deal was learned about how social capital can contribute to not only poverty reduction but also the strengthening of communities in general. Michael Woolcock, Deepa Narayan, and their colleagues developed a view how social capital reduces poverty. Their description of the dynamic includes a special place for contributions from multinational economic organizations, such as international corporations. Moreover, for poverty located in rural, isolated regions of the world where the national government's presence is sparse, the extractive industries, according to this view, have a unique opportunity to be a force for community development.

Because social capital is ubiquitous to varying degrees in all human interaction, it has been defined many ways to suit many different contexts. About a century ago, Hanifan (1916) coined the term to draw the attention of the business community to the link between rural isolation (i.e., a lack of social capital) and rural poverty in the USA state of West Virginia. Perhaps the definition that best captures the most common understanding of the term is Cohen and Prusak's (2000) version:

Social capital consists of the stock of active connections among people: the trust, mutual understanding, and shared values and behaviors that bind the members of human networks and communities and make cooperative action possible. (p. 3–4)

Cohen and Prusak's definition captures the sense of the concept as used by urbanists, like Jane Jacobs (1965), and political scientists, like Robert Putnam (2000). However, sociologist Mark Granovetter (1983) and economist Glenn Loury (1977) focused on how ties to people outside one's circle of similar others were a more

important aspect of social capital for things like finding a job. Gould and Fernandez (1989) developed the notion of brokerage opportunities presented by occupying a network position between two or more network members or clusters who have no direct links with each other. Ronald Burt (1997) developed this line of thinking further as a mathematical description (i.e., “inverse constraint”) of network positions that enjoy unrivaled access to resources located in further reaches of the network and that present brokerage and coordination opportunities. Gittel and Vidal (1998) spoke of a similar type of outreaching social capital as important in community development. They called it “bridging” social capital and distinguished it from the “bonding” type described in the Cohen and Prusak definition.

A third type of social capital, called “linking,” was proposed by Narayan (1999), Woolcock (2001; Szreter and Woolcock 2004), and their colleagues working on understanding the role of social capital in poverty reduction. Molinas (2002) summarizes the distinctions among the three types by characterizing bonding as ties among family members, friends, and neighbors, bridging as ties with colleagues and associates who are demographically dissimilar, and linking as “alliances with sympathetic individuals in positions of power.” Linking is like bridging except that instead of connecting to another bonded cluster in the community, or another village in the region, the tie is to an organization at a higher level of scale that has access to more resources. These higher level organizations could be national government departments or programs, national or international development organizations, or national or international companies. The framework that emerged from studies of successful cases of poverty reduction portrayed a balance of all three types of social capital as necessary for a poor community to be able to prosper.

The extractive industries have a special role to play in the process of reducing rural poverty because they are more likely than other industries to actually enter and operate in remote regions. To the extent that extractive industries can promote a balance of bonding, bridging, and linking social capital in those regions, they help reduce poverty

and promote development. The focus is on understanding and deliberately enhancing the social structure of the networks in and among the communities. It does not matter whether the concrete initiatives for promoting such a balance involves building infrastructure, protecting the natural environment, or offering jobs. What matters is how any initiative that the community supports would change the structure of the regional social network. Although this is a less tangible goal than whatever service, program, or infrastructure might be incidentally involved in the initiative, it is nonetheless a measurable, quantifiable, and trackable goal (e.g., Molinas 2002; Boutilier 2011).

In an unbalanced excess, each type of social capital presents a different type of obstacle to development. For example, too much bonding can prevent growth by excluding outsiders from economic transactions (Portes and Landolt 2000). Onyx and Bullen (2000) found that bonding without bridging can also be associated with prejudice against outgroups and a reduced appetite for any kind of change. However, without bonding, there is little capacity for agreeing on goals and collaborating toward them. Even when both bridging and bonding are present, without linking, the opportunities for development are limited. However, linking without sufficient bonding and bridging can facilitate the emergence of an elite among those who do the linking, with negative impacts on the level of democracy in community organizations (Titeca and Vervisch 2008). The findings of Pena López and Sánchez Santos (2014) indicate that bonding and linking without bridging can promote networks of corruption. In general, a consensus has emerged that not only are there different kinds of social capital, but that each kind can have both positive negative aspects when they are not balanced and when a broad enough range of social impacts and contexts are considered (Portes and Landolt 1996, 2000; Streeter 2002; Beugelsdijk and Smulders 2004; Realo et al. 2008).

Boutilier (2011, pp. 44–56) summarized many of the findings in a typology of social network structures that compares three levels of bonding with three levels of core-periphery structure,

which entails a dimension of bridging. The typology was intended for use by organizations that themselves provide the linking social capital to the community or stakeholder network with different combinations of bonding and a variant of bridging. For example, the completely bonded community with no bridging will be slow to accept any change at all and slow to trust outsiders. The community in which a small self-serving elite core provides the only bridges among completely unconnected members of a periphery will accept an extractive industry but the benefits will flow exclusively to the members of the core elite. A community with a weak core incapable of coordinating highly bonded peripheral cluster will experience self-defeating internal conflicts as each cluster competes with the others to capture more of the benefits, or at least to ensure that no other group gains too much power. Boutilier suggests that a structure dubbed “accountable leadership” provides enough balance between group bonding and diversity bridging to permit a community to benefit from the linking social capital that the presence of an extractive industry offers.

This approach to community relations emphasizes deliberate changes to the social structures, as opposed to the unwitting changes that would happen by default. The focus on social capital is very congruent with the approach to community development known as “community resilience” (Berkes and Ross 2013; Walton et al. 2013; Aldrich and Meyer 2015). The community resilience approach views the community as a system integrated within its ecosystem and multiple levels of social systems. It emphasizes the capacity of the community for dynamic self-organization and collaboration toward shared goals. Magis (2010) defined community resilience as the “existence, development and engagement of community resources by community members to thrive in an environment characterized by change, uncertainty, unpredictability and surprise.” These abstracts translate into measurable variables when the community is viewed as a network of social capital ties. The emphasis on multiple levels of embeddedness fits well with the notion of linking social capital. The idea of

joining together to reach common goals implies bridging social capital to overcome separations among naturally occurring social clusters and bonding social capital to facilitate collaboration.

Magis (2010) explains how community resilience can be analyzed and measured using the construct of community capitals. She notes that economic resources, or the lack of them in the case of poverty, are not the only kind of resources communities can mobilize. The community capitals construct provides framework for understanding how communities combine diverse types of resources or “capitals.” There are varying lists of community capitals (Rainey et al. 2003; Roseland 2012). Flora and Flora (2004) offer the most extensive list with seven types of capitals: (i) natural (environmental), (ii) financial (present and projected), (iii) built (infrastructure), (iv) human (skills, knowledge), (v) cultural (shared knowledge about how to provide for needs from the physical need for shelter to social and spiritual needs), (vi) political (ability to access resources and power brokers, and ability to impact the rules and regulations), and (vii) social.

The community capitals construct is embedded in an approach to development that promotes self-sufficiency and sustainability right from the start. The outsiders wishing to help do not set the agenda or the type of help to be provided. Instead, they solicit the collaboration of the community in developing an agenda and goals. Fazal et al. (2016) reviewed different approaches to community development and found that the least sustainable approaches were characterized by the helpers deciding on their own how best to help the community. They concluded that the sustainability of community projects depends on the community identifying its problems and proposing solutions.

The community development approach that allocates all the agenda setting decisions to the “helper” is typified by the technique known as community needs assessment. It presumes that the helper defines the categories of needs, compares their urgency, and proposes solutions. Even with this approach, however, the benefits of more equal collaboration in the process are increasingly appreciated (e.g., Macaulay and Ryan 2003;

Jagosh et al. 2015). The approach variously described as community resilience or community capitals may start with an understanding of the authority and influence structure of the community (i.e., social capital) and then focus on the community's assets rather than deficiencies and needs. The helper participates in ways that bring the three social capitals into more balance as the community itself sets its goals and assesses the types of capital it could combine to achieve them.

A participatory method for discovering the social capital structure of communities has been developed by Schiffer (Schiffer and Peakes 2009; Schiffer et al. 2010; Schiffer and Hauck 2010). The core of the method involves convening community stakeholders to map their own social capital. Using physical objects to represent social actors, participants jointly construct the social network of their community and its associated outside stakeholders. The method has the advantages of being low-cost but highly engaging. Indeed, community participants invariably begin to take ownership of the process of crafting their own social capital.

In his guidance for social investments by oil and gas companies, Zandvliet (2008) emphasized that a social investment can only be sustainable if the community takes responsibility for it. Moreover, Zandvliet advises that additional partners from government and civil society should be involved from the beginning as well. Most extractive companies will only be present in host communities from five to fifty years. Their withdrawal from any initiatives has to be planned from the start. This is why building social capital among the other stakeholders is so important. If government and community organizations have not developed the human and social capital to continue combining their many other capitals, initiatives to reduce poverty will stall. Therefore, one of the best contributions extractive companies can make while they are present in a region is to help stakeholders coconstruct their own human and social capital.

Although social capital building and balancing is essential for community development, community development itself has its opponents. For example, where there are self-serving elites, the

elite will resist the dilution of its power and authority. They may even be skillful enough at the construction of deceitful narratives to enlist the help of activists from either the national capital or the developed world to help them resist change. There are also nonelite forces that, in effect, work to maintain poverty. Where corruption and clientelism are widespread, even the poor themselves will resist initiatives that aim to operate on the principles of inclusiveness and transparency. Community development is easy in theory but in practice it is "the art of the possible." Nonetheless, the conceptual frameworks and practical tools that social capital offers can make better outcomes more probable.

## Respect and Business Ethics

Claudia Eger

Philosophy, Copenhagen Business School,  
Frederiksberg, Denmark

## Synonyms

Dignity; Moral principles; Moral rights; Self-respect

## Introduction

Respect moralizes and mediates human relations, playing a vital role for business ethics and the

examination of meaningful work (Bowie 2017). While there exist different kinds of respect, respect always has an object it is directed toward (Dillon 2018). This is described as the responsiveness of respect, which exacts certain conduct in us. The deontological ideal of respect directly determines “our will without reference to what is wanted by our inclinations” (Rawls 2000: 153). Our deferral to the object’s demands places restrictions on what is allowed for one to do. Through the legacy of Enlightenment, hierarchical notions of respect have increasingly ceded to ideals of human equality (Bird 2004). The general Kantian assumption that every person has the standing to demand equal treatment is rooted in the assertion that each human being should be treated as an “end in itself” (Kant [1785] 1964: 96). While the Kantian premise of respect is only due to (rational) human beings with the capacity to be autonomous, recent discussions of respect have been influential in advancing the understanding of diversity inherent in respecting individuals as unique and particular (see, e.g., care ethics, Eger et al. 2019). The sections that follow elaborate upon the moral relevance of respect for business, introducing Darwall’s (2006) work on recognition respect to address the prevalent absence of second-personal considerations in conceptualizations of (equal) respect in business ethics.

## Respect for Persons

The universalizing spirit of the Kantian claim for equal treatment and commitment to finding in all humans a common ground is based on two fundamental commitments. First, the belief in the inherent dignity of a person demands respect in conduct and treatment that is owed to all persons (Bird 2004). The egalitarian foundation of Kant’s respect for persons’ principle demands that respect is not due to some more than others. This breaks with the hierarchy often implicit in formulations of respect based on discourses of honor and shame (Eger 2021) and beliefs of superiority and inferiority (Bird 2004). Second, the respect

for persons principle is primarily evoked through a “deliberative disposition” (Bird 2004: 209, *italics in original*), which sets it apart from the social meaning associated with performative modes of respect that are inbuilt to social or traditional expectations. Rather, the Kantian position is construed upon the “quality of the deliberation that precedes” it, which is further a form of deliberation that remains at a certain distance to the person, i.e., “I am distant from you in the same way as you are distant from me” (Cohen 2008: 40). Respect holds us mutually accountable, providing individuals with the authority to exact respect (Kant [1785] 1964), though the question remains of how our deliberative disposition is evoked in these relationships. To answer this question, Darwall’s (2006, 2013) work on recognition respect is of relevance here.

## Recognition Respect

Darwall’s (2006) concept of (moral) recognition respect is based on the Kantian premise that all persons are owed respect, but he links its universal meaning to human relations of mutual accountability. Recognition respect responds to “a person’s dignity and authority to make claims and demands of us” (Darwall 2010: 153). It is concerned with how we regulate and govern our relationships to one another. Darwall describes dignity as a second-personal authority rooted in relationships of mutual accountability. “Part of what it is for persons to have dignity is for them to have the standing to hold each other accountable for complying with their legitimate claims and demands of one another” (Darwall 2010: 156). Second-personal perspectives of respect offer an insight into the ethical reasons for acting, alluding to a notion of dignity that is not primarily individual but grounded in the relational constitution of dignity claims.

Darwall captures the reciprocal relationship inherent in the concept of respect through the second-person standpoint, i.e., “the perspective you and I take up when we make and acknowledge claims on one another’s conduct and will”

(Darwall 1977: 1). The second-person standpoint invariably involves agents in relation to one another. It requires a second-personal address, such as that expressed in moral obligations and demands stemming from the moral community (Darwall 2006). Imagining respect through the equal standing to demand certain behavior from each other (between you and I, instead of “she” or “he”) ties respect to second-personal reasons. The absence of second-personal authority sheds a critical light on relationships of unequal respect.

Darwall (2013) distinguishes between mutual recognition respect and recognition respect enacted as part of a culture of honor, i.e., honor respect. Honor respect emphasizes differences in status and is bestowed on individuals by society. It is based on an epistemic-like authority that does not require a second-personal acknowledgment. This alludes to a sense of dignity that is based on a preemptive standing in society which legitimizes unequal or different dignity claims, which come to bear on workplace relations. Status beliefs based on honor respect do not view status and worth as unconditionally given. Rather, the transformation of honor respect into status differences constrains individuals’ ability to develop a sense of entitlement to respect and becomes inscribed in organizational structures and practices that engender persistent inequality, as illustrated in the context of women’s employment and gender segregation (Eger 2021).

## The Moral Relevance of Respect for Business Ethics

Discussions of respect in business ethics often draw on a Kantian formulation of the moral position and recognition of autonomous beings as equal in their humanity and dignity (Bowie 2017). Arnold and Bowie (2003) argue that the Kantian respect for persons principle is in line with equality that manifests the range of valued beings and doings available to an individual. Morality, however, cannot be explained through autonomy alone, as “our belief that we owe one another respect must ultimately be based on our *actual relations* with one another” (Buss 1999:

357, *italics in original*). These ideals of human equality rest on an account of mutual respect (Darwall 2006, 2013). Being recognized as equal presupposes a process of mutual deference which entitles both to claim and demand. Bird (2004: 215), however, cautions that “the realization of human equality is an effect, not a cause, of the respect due to persons: the relevant sort of equality is an emergent property arising from a distinctive pattern of submission and deference.”

Respect has been used widely in normative ethics to justify moral rights and principles of equality (Dillon 2018), though our concept of “equal respect” remains underspecified (Bird 2004). Darwall (2013) posits that the interrelationship of honor with differences in status is distinct from mutual recognition respect, which focuses on the dignity of each person and the capacity to be morally obligated. This alludes to a tension between conceptions of honor respect and mutual recognition respect, as the former are deemed to exclude the possibility for equal (recognition) respect (Darwall 2013). Questions about disrespect and status inequality remain central to discussions of meaningful work. How we treat others and what we consider to be commendable or condemnable requires attention to different modes of valuing to specify valuing distinctions and how value is constituted to further our understanding of respect (Anderson 1993; Eger 2021).

## Conclusion

Learning about respect and how respect is harnessed in business relationships is of essence to advance the ethics of business. This requires sensitivity to conceptions of unequal worth and individuals or groups’ different sense of entitlement to respect. Status beliefs prevailing in a specific context have a significant influence on what and who is to be respected and in which ways. We could argue that the view of morality as equal accountability remains an ideal, though the recognition of its second-personal character ties respect into relationships of thou and I that

demand our attention and deep reflection on the politics of respect in everyday work life.

## Responsible Investors and Company Standards: Follow the Money to Rate the Raters

Andreas G. F. Hoepner<sup>1,2</sup> and Pei-Shan Yu<sup>2,3</sup>

## Introduction

Responsible investors require unbiased information on the outcomes of corporate social responsibility (CSR) activities to direct (withdraw) their capital toward those entities with positive (negative) impact. Companies, however, have clear incentives to manufacture a positive tilt into any CSR information they release. Third-party entities therefore launch corporate standards to reduce that tilt and mitigate any potential bias. Companies react to these initiatives by offering significant funding to these third parties, whereby they create a context of corporate capture in which some third-party executives may be indebted to these corporations rather than aligned with their original mission. To navigate this complex web of information asymmetries, external buy-side rating agencies offer supposedly unbiased views to responsible investors. In this context, we aim to inform the research questions: How *good* are these rating agencies? And how *dependent* is their existence on corporate cash flows?

We aim to inform two research questions:

1. How reliable are external CSR rating agencies?
2. How independent are these rating agencies from cash flows received by the rated entity?

Regarding our first research question, several previous studies have attempted to rate rating agencies (Cerin and Dobers 2001; Chatterji et al. 2015; Dorfleitner et al. 2015). Such approaches have usually developed some sort of assessment criteria catalogue and then scored rating agencies accordingly. We do not believe that it makes a relevant contribution to the academic literature or the professional development of the responsible investment sector by proposing yet another assessment criteria catalogue for CSR rating agencies. Hence, we draw on the fact that significant academic literature has been published by 2017 using data from well over a dozen rating agencies and conceptualize their quality, based on the published papers.

To inform our second research question, we exploit the information contained in the Deep Data Delivery Standards ([www.DeepData.ai](http://www.DeepData.ai)). Proposed by a number of responsible investors and academics in their personal capacity, these standards do not only aim to influence the rating process itself but rather to define how data sets should be delivered to clients, both in terms of quantitative aspects such as completeness and formatting and qualitative aspects such as financial independence from the rated entity.

Our text is structured as follows: section “[Literature Review](#)” describes our literature search, and section “[Inferring the Quality of Rating Agencies from Academic Research](#)” assesses the degree to which rating agencies can be rated based on the academic studies using their data. Section “[Follow the Money Chain to Rate the Raters: The Deep Data Deliver Standards](#)” discusses the Deep Data Delivery Standards with its requirement of financial independence from the rated entity before section “[Conclusion](#)” concludes.

## Literature Review

We commence our literature search by defining the CSR rating agencies themselves as the search terms used, since the agencies themselves prove significantly more effective search terms than the concepts that underpin them. In discussions with our advisory board and other responsible

investment professionals, we define the following 24 rating agencies as our search terms:

1. ASSET4
2. Bloomberg ESG
3. CDP
4. Dow Jones Sustainability Index (DJSI)
5. EcoVadis
6. EIRIS
7. eRevalue
8. Ethix
9. FTSE4GOOD
10. GES
11. Glass Lewis
12. GMI
13. Innovest
14. ISS
15. KLD
16. MSCI ESG
17. Oekom
18. RepRisk
19. RobecoSAM
20. South Pole
21. Sustainalytics
22. Trucost
23. TruValue Labs
24. Vigeo

However, this does not mean that we will limit ourselves to only analyze studies including data by these agencies. Instead we conduct our literature search via Scopus and eventually check references of the identified papers as well as studies citing the identified papers to identify further literature. We use Scopus rather than Web of Science since the former has a larger coverage of peer-reviewed journals especially in the social sciences (Hoepner et al. (2016). However, as neither Scopus nor Web of Science can claim completeness, we complement our search with Google Scholar.<sup>1</sup>

Of all the peer-reviewed publications, which used data from a CSR rating agency, two types are of interest for our goal of assessing the quality of

<sup>1</sup>As with any literature search, we cannot rule out the possibility of having missed a study. Hence, we are very grateful for further suggestions by interested readers.

the external rating agencies: first, studies that conducted direct quality assessments by comparing CSR rating agency judgments with verified external data. While several authors (e.g., Chatterji et al. 2015; Dorfleitner et al. 2015) have published significant contributions in the area, the total number of studies and especially the number of CSR rating agencies used in these direct assessments are too small, as of 2017, to “rate” any meaningful number of rating agencies.

Hence, we proceed to the indirect assessments of the quality of rating agencies. Hereby, we mean studies which analyze the effect of CSR scores on a measure of corporate financial performance, preferably but not necessarily the return received by responsible investors. While these studies do not directly assess the quality of CSR rating agencies and any significant positive result does not imply that the assessment is necessarily entirely accurate, significant positive findings do imply usefulness for responsible investors and can hence be perceived as an approximation for quality, albeit obviously an incomplete one.

For each indirect assessment study which we identify in the literature, we retrieve the following information: title, authors, publication year, publication outlet, sample source and period, data providers used, and estimation model applied. We further separate these studies into two groups: (i) shareholder return studies that directly measure the financial materiality of CSR scores for responsible investors and (ii) alternative proxies of financial performance, which may or may not result in increased return to responsible investors and are, as a cohort, less comparable since they depend on heterogeneous accounting practices across sectors and countries. Consequently, our analysis in the next section focuses on shareholder return studies, but we also list those studies with alternative financial performance measures.

## Inferring the Quality of Rating Agencies from Academic Research

We identify 25 studies that directly measure the financial materiality of CSR rating agency data in terms of abnormally positive stock returns using

Jensen’s (Jensen 1968) Alpha or more advanced measures. The vast majority of these studies builds portfolios of companies with equivalent ratings and compares their performance.<sup>2</sup> The distribution of the sign and significance of these alphas are plotted in Table 1.

The results are remarkable albeit not necessarily in a good sense. With the exception of Asset4, Bloomberg, CR Magazine, Deminor, DJSI, and Regnan, all other rating agencies’ results have significantly more positive than negative alphas. Looking into those studies which use alternative proxies of financial performance listed in Table 2, we observe a similarly strong preference for positive narratives. This allows for two very conflicting conclusions: CSR rating agencies are across the board pretty good in forecasting stock returns with their ratings or the academic publication process on CSR rating agencies is subject to a significant publication bias due to editors, authors, and/or other stakeholders displaying a preference for significant (positive) results (Doucouliagos and Stanley 2013).

While it is beyond the scope of this chapter to resolve this conflict, it is crucial to highlight its two inevitable implications: first, we tried to rate rating agencies based on the results from academic research but need to conclude that this will only be possible once the potential publication bias is sufficiently controlled for. Second, if publication bias exists, then all meta-analyses tying CSR to financial performance relationship are subject to this bias.

Hence, we call for meta-regression analysis to be conducted, which can identify and correct for publication bias based on the relationship between effect sizes and degrees of freedom (Doucouliagos and Stanley 2013; Stanley and Jarrell 1989). We remain focused on differentiating rating agencies at least in some form and hence continue to examine, if these firms can be rated on the financial independence.

<sup>2</sup>Please note that we only include studies that use corporations as unit of analysis. We exclude studies that focus on mutual funds or indices.

This table presents the sign and the statistical significance level of alphas in academic studies by each data provider. The figures show the total number of alphas identified for each provider for all studies reviewed. Columns 1 to 3 show the significantly negative alphas at 1%, 5%, and 10% level, column 4 shows the number of insignificant alphas, and columns 5 to 7 show the number of significantly positive alphas at 10%, 5%, and 1% level. Studies included in the review are as follows: Bauer et al. (2004, 2008), Belghitar et al. (2014), Brzezczyski and McIntosh (2014), Chan and Walter (2014), Chong and Phillips (2016), Derwall et al. (2005, 2011), Edmans (2011), Erragragui and Revelli (2016), Filbeck et al. (2014), Galema et al. (2008), Halbritter and Dorfleitner (2015), Humphrey et al. (2012a, b), Humphrey and Tan (2014), Kempf and Osthoff (2007), Kollias and Papadamou (2016), Lee and Faff (2009), Lee et al. (2013), Levi et al. (2016), Limkriangkrai et al. ## Follow the Money Chain to Rate the Raters: The Deep Data Delivery Standards

Goal 16.5 of the Global Sustainable Development Goals (SDGs) demands we “[s]ubstantially reduce corruption and bribery in all their forms.” Bribery, in its widest form, is the payment of money or gifts to tilt someone’s actions in one’s favor to the disadvantage of third parties. Mainstream approaches to credit ratings have long been criticized for the significant conflicts of interest involved in the rating agency being paid by the issuer. In fact, academic evidence shows that non-solicited credit ratings, which the issuer did not

pay for, are significantly lower than those solicited (i.e., paid for) ratings (Baghai and Becker 2018; Bollen et al. 2011; Poon 2003).

To address such conflicts of interests in external rating processes, a group of professional responsible investors and academics with in-depth expertise in the area launched the Deep Data Delivery Standards ([www.DeepData.ai](http://www.DeepData.ai)) as a pro bono initiative in their personal capacity. Apart from ensuring professional formatting, machine readability, and an accountable procedure for dealing with potential errors, the standards focus particularly on the financial independence of the rating agencies from the rated entity.

**Responsible Investors and Company Standards: Follow the Money to Rate the Raters, Table 2** List of studies using rating agency data and alternative (non-alpha) proxies for financial performance

| Data provider                         | Author (year)                   | Variable(s) of interest                                                           | Model/method applied                                        | Main result                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------|---------------------------------|-----------------------------------------------------------------------------------|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ASSET4</b>                         | Peiró-Signes et al. (2012)      | ROA, EBITDA margin, REVENUE per employee, net current assets, cash flow per share | ANOVA test to compare BIC <sup>a</sup> and WIC <sup>b</sup> | “Selected US companies in the bottom 25% (Worst-in-class) of their industries according to ESG scores perform significantly better than those in the top 25% (BIC). We also found that BIC companies have significant higher revenue per employee and cash flow per share compared to industry medians”                                                                                                                                                                                                                                                        |
|                                       | Aouadi and Marsat (2016)        | Tobin’s Q, market-to-book ratio, operating income on assets (sales), RoE          | OLS                                                         | “ESG controversies exert a surprisingly significant and positive effect on firm market value. However, after introducing the interaction term (with CSP score), the direct effect of ESG controversies completely disappears but the interaction term is positive and significant. These results hold only for high-attention firms, i.e. those which are larger, perform better, receive more investors’ attention, or are located in countries with greater levels of press freedom”                                                                         |
|                                       | Chang et al. (2016)             | RoA, Tobin’s Q, excess portfolio return                                           | Panel firm fixed effect regression, 5-factor FF model       | “Unexpected cash giving, but not unexpected in-kind or total giving, is associated with improved CFP, suggests that different types of corporate philanthropy have heterogeneous effects, most likely through alternative channels, as they rely on different resources. Cash giving stands out as a passive signalling tool. Information value of cash giving is more pronounced at firms which lack alternative signalling mechanisms”                                                                                                                       |
|                                       | Daszynska-Zygadlo et al. (2016) | Tobin’s Q, PE ratio                                                               | OLS                                                         | “Social performance relatively the least important: giving statistically significant change only for 4 sectors with respect to Tobin’s Q (3 in the case of PE ratio). Corporate governance is value creating for materials, financial and industrials (Tobin’s Q), and 5 cases for PE ratio but they always reduce the potential to earn current abnormal earnings. Environmental performance is a significant but negative factor for Tobin’s Q in 8 sectors (7 for PE ratios), and hence the hypothesis about positive impact on value creating is rejected” |
| <b>Bloomberg ESG disclosure score</b> | Nollet et al. (2016)            | Firm-level financial performance indicators (RoA, RoC, excess stock returns)      | Panel regression model                                      | Results suggest, in linear specifications, the effect of CSR performance is positive but insignificantly related to all measures of CFP. For both RoA and RoC, there is a significant U-shaped relationship between CSP-CFP in the nonlinear (quadratic model), while the effect of CSP on excess stock returns is insignificant                                                                                                                                                                                                                               |

| Data provider     | Author (year)                                      | Variable(s) of interest                                        | Model/method applied                                                                          | Main result                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|----------------------------------------------------|----------------------------------------------------------------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | Fazzini et al. (2016)                              | Firm-level market capitalization to book value of equity ratio | Accounting-based valuation model (Cormier and Magnan (2007)), analogue to Ohlson model (1995) | Results partially support initial conjectures, i.e., the environmental voluntary disclosure represents value-relevant information positively correlated with firms' market value. Furthermore, when such information is subject to an independent assessment for the reporting period, an incremental benefit deriving from the assurance of such information cannot be found     |
|                   | Arayssi et al. (2016)                              | Risk (volatility and beta), risk-adjusted returns (FF)         | Multivariate panel regression                                                                 | "An increase in the participation of women directors directly affects ESG disclosure. Women on corporate boards reduce the firm risk through ESG disclosure. ESG disclosure increases firm performance at high levels of women participation on boards. On the other hand, having more women on corporate boards seems to generate significant negative excess returns"           |
| DJSI <sup>c</sup> | Lourenço et al. (2012)                             | Market value                                                   | Ohlson model (1995), random effect regression                                                 | "CSP has significant explanatory power for stock prices over the traditional summary accounting measures such as earnings and book value of equity. Our findings suggest that what investors really do is to penalize large profitable firms with low level of CSP"                                                                                                               |
|                   | del Mar Miralles-Quirós and Miralles-Quirós (2017) | Market value                                                   | Ohlson model                                                                                  | "Overall results are consistent with the value-creating theory; positive impact of sustainability leadership on firm value is primarily driven by German and Swedish listed firms, while markets with stronger shareholder protection and higher requirements for CSP transparency do not provide significant results"                                                            |
|                   | Forcadell and Aracil (2017)                        | Return on average assets                                       | Linear fixed effect regression                                                                | "Prior to the economic turmoil, RCSR (reputation for CSR) positively influenced financial performance. Banks that fulfil DJSI requirements in a given year experienced an improvement in their economic performance compared to low sustainable peers not belonging to DJSI during that period"                                                                                   |
|                   | Swidler and Crutchley (2009)                       | Sharpe ratio, Tobin's Q                                        | Mean difference test                                                                          | "On average, sustainable firms earn greater returns than large cap companies. However, when compared to industry matched companies, the risk-adjusted returns are no greater than those of the matched sample, nor is the risk of sustainable companies lower. While the Q ratios of sustainable firms are higher than the industry matches, the difference diminishes over time" |

| <b>GES</b>      | Semenova and Hassel (2008)   | ROA and Tobin's Q                                        | Pooled OLS cross-sectional time series                         | Higher level of inherent industry risk is associated with higher ROA (operating performance) but also with lower Tobin's Q (market value) for US companies. In high-risk industries, environmental preparedness is positively related to market value; however it is negatively related to operating performance                                                                                                                                                                                                         |
|                 | Lopatta and Kaspereit (2014) | Market value                                             | Ohlson valuation model                                         | Since the financial crisis starting with Lehman Brothers Sep 2008, the capital market's attitudes toward corporate sustainability have shifted in a positive direction. The study also shows this shift has led to a negative perception of the interaction between sustainability at the industry and the firm level. In industries with higher environmental and social risks, corporate sustainability is more important and acts as a compensating management strategy. Sustainability is relevant to firm valuation |
| <b>Innovest</b> | Guenster et al. (2011)       | ROA and Tobin's Q                                        | Multivariate cross-sectional model (Waddock and Graves (1997)) | A positive relation between eco-efficiency and operating performance is found, though asymmetric. The study also provides new evidence to a positive and time-varying relation between eco-efficiency and firm valuation (measured by Tobin's Q). Over time, the valuation differential between winners and losers increased substantially                                                                                                                                                                               |

| <b>KLD</b>      | Kim (2015)                   | FP model: EBIT/sales ratio, Tobin's Q in robustness test | Random effect panel                                            | "The statistical evidence supports the argument that EP and FP have a positive relationship. Different and inconsistent FP measures explain the lack of consensus about the relationship in the literature. Generally, market-based FP has a more consistent relationship with EP in the concurrent model, but EBIT/Sales represents the relationship in the time-lagged model. Recent past FP in terms of accounting-based profitability can be a better predictor of corporate FP. EP is a function of preceding FP"   |

|-----------------------|-----------------------------|-----------------------------------------|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sustainalytics</b> | Auer (2016)                 | Sharpe ratios                           | Bootstrap test (Ledoit and Wolf (2008)) | “(i) Negative screens excluding unrated stocks from a representative European stock universe allow investors to significantly outperform a passive investment in a diversified European stock benchmark portfolio. (ii) Additional negative screens based on environmental and social scores neither add nor destroy portfolio value, when cut-off rates are not too high. In contrast, governance screens can significantly increase portfolio performance under similar conditions. (iii) Because of a loss of diversification, positive screens can cause portfolios to underperform the benchmark”                      |
|                       | Auer and Schuhmacher (2016) | Sharpe ratios                           | Bootstrap test (Ledoit and Wolf (2008)) | “Regardless of geographic region, industry or ESG criterion, active selection of high- or low-rated stocks does not provide superior risk-adjusted performance in comparison to passive stock market investments. Second, in the Asia-Pacific region and in the United States, investors concentrating on ethical utility derived from their portfolio choice can follow an ESG-based investment style and still obtain a performance similar to the broad market. However, depending on the industry focus and the ESG criterion that is used, investors in Europe tend to pay a price for socially responsible investing” |
|                       | Walker et al. (2016)        | ROA, asset turnover ratio, Sharpe ratio | Panel regression                        | “Increased CSR significantly relates to increased firm performance in all three measures, and that increased CSiR significantly relates to decreased profitability only. Furthermore, increased CSR when CSiR is present relates to increased efficiency and market valuation. Finally, increased CSiR when CSR is present relates to increased profitability and efficiency. The results suggest that CSR dominates the relationship to firm performance, as it was positively related to all three measures of firm performance, and when CSR and CSiR exist simultaneously, CSR has a dominant positive effect”          |

<sup>a</sup>Best-in-class<sup>b</sup>Worst-in-class<sup>c</sup>Dow Jones Sustainability Index<sup>d</sup>As of October 2009, KLD (Research and Analytics, Inc.) operates as a subsidiary of MSCI ESG Research, Inc.

Specifically, standards 6 and 7 read as follows:

- #6: “Deep data sets are expected to be delivered with an assurance of individual rating

independence meaning that none of the rated entities in the respective market (e.g. equity index) financially contributed to their rating or paid for access solely to their own rating”.

- #7: “Deep data sets are expected to be delivered with an assurance of organizational rating independence meaning that whenever rating agencies win entities as new clients, which they also rate, an independent analysis is conducted if these new clients receive statistically significant higher ratings than in the year before and any biases found in this analysis will be addressed within 12 months” ([www.DeepData.ai](http://www.DeepData.ai), 2016:1).

While nearly all the large CSR rating agencies have engaged with the Deep Data Delivery Standards (although only MSCI ESG, Oekom, and RepRisk signed in year 1), none of the credit ratings has done so to date. The (occasional lack of) quality of these credit ratings became apparent in the financial crisis of 2008/2009, as they apparently had *ex ante* shown little interest to bite the hand that feeds them. Similarly, auditors have, in total, qualified a surprisingly small number of accounts in recent years, while they had to pay heavy fines in other cases for signing off accounts which turned out to be far from the truth (e.g., Sino-Forest).

These examples should prove a loud warning for responsible investors that financial independence of the rating agency from the rated entity is probably the most crucial quality criterion when assessing these rating agencies. In fact, we use our academic freedom to argue that only those assessments which are financially separated from the rated entity deserve the name “independent rating.” Assessments that are directly paid for by corporations may well have more in common with testimonials than with independent analysis.

## Conclusion

In summary, we avoided drawing up yet another list of significantly subjective assessment criteria to rate the raters and aimed to utilize the dozens of academic research studies available by 2017 to assess their quality. We identified dozens of studies plotted in Table 1 and described in Table 2 but could not distinguish between them, due to either a significant publication bias or a conclusion

which would have rated the vast majority of these raters as pretty good. To address this weakness in the literature (including all meta-analyses), we call for meta-regression analyses to be conducted, as these can identify and control for publication bias.

We do, however, find one crucial criteria to separate rating agencies: financial independence. Specially, we argue that one can only speak about an independent rating, if the assessment was not directly paid for by the assessed entity, as the latter case is inseparable from testimonials. Consequently, the Deep Data Delivery Standards represent a means to separate financially independent rating agencies from those that may not be. They have been signed in year 1 by MSCI ESG, Oekom, and RepRisk, though others may follow and sign in the second year.

## Responsible Leadership and Crisis Management

Tulika M. Varma

Strategic PR Insights, Mumbai, India

## Synonyms

Crisis management; Responsibility compass; Responsible Leadership

## Introduction

The heightened attention to the field of Responsible Leadership in the last two decades has enriched the scholarship as it pertains to its conceptualization, its practice in different contexts at multiple levels with several antecedent conditions and outcomes (Miska et al. 2018). Despite this growth, there is limited research on the impact of the Responsible Leadership in crisis management. Paradoxically, the development of Responsible Leadership as a social and moral phenomenon has been influenced strongly by corporate illegalities. One of the reasons that crisis management has received scant attention within Responsible Leadership scholarship could be explained on the basis that crises are low-probability events and leaders in most organizations perceive their organization to be invulnerable and have a false sense of confidence in their abilities to be able to develop a solution in the event of a crisis (Pearson and Clair 1998).

Responsible leadership is evidenced in defining moments when leaders must make critical decisions that have long-term impact on the future of the organization (Pless 2007), and an organizational crisis is one of them. These moments reveal the fundamental character and integrity of the leader. This brief overview of Responsible Leadership and crisis management situates the role of the Responsible Leadership within Miska et al. (2018) three levels of analysis micro, meso, and macro. The micro level will focus on individual business leaders; the meso level on the organizational context and the corporate strategy; and the macro level on the institutional culture and society.

### Responsible Leadership and Crisis Management at the Micro Level

At the *micro* level, the Responsible Leadership scholarship recognizes the importance of character traits such as relational intelligence, emotional and ethical intelligence, and authenticity and integrity (Maak and Pless 2006). It emerges that there is thin research into crisis management within the Responsible Leadership framework at the microlevel. Future research in this area might examine how these personal character traits of Responsible Leadership explain the selection of the four approaches identified by Pless et al. (2012) that focus on economic imperatives and stakeholder relationships: (i) *Traditional Economists* – who focus on short-term economic value for the firm and shareholder orientations; (ii) *Opportunist Seekers* – who engage in economist activities for instrumental reasons; (iii) *Integrators* – who see profit as an outcome of Responsible Leadership; and (iv) *Idealists* – who hold a broad perspective of business rooted in strong ethical considerations and spiritual/religious beliefs. Furthermore, research at the micro level might examine the outcomes of the linkages between individual leader traits and the approaches through which they manage the crisis and how it might be measured or evaluated.

### Responsible Leadership and Crisis Management at the Meso-Level

At the meso-level findings from a study by, Coldwell et al. 2012, suggested that Responsible Leadership during a crisis can reduce instability for organization and reassert stable state more rapidly. They developed a responsibility compass, based on the works of (Paine 2006) and Fombrun (1996) for the responsible management of a crisis. This stepwise model identifies seven crisis mitigation steps to responsibly manage a crisis: 1. early disclosure of a crisis and accepting responsibility; 2. disclosing information openly to the media; 3. selecting governance leadership to manage the crisis; 4. rebuilding confidence/trust; 5. restructuring for credibility; 6. demonstrating social concern; and 7. apologizing publicly. The focus is on the processes through which responsible crisis management is achieved. They demonstrated through empirical research that Responsible Leadership during an organizational crisis helps to protect reputational assets as measured through its impact on share prices. This study, however, did not address leadership traits such as decision-making capabilities and stewardship, qualities deemed fundamental to the Responsible Leadership paradigm. In a crisis situation, the leader, therefore, must serve as the gestalt who upholds the business values and steers the business responsibly and with integrity while protecting the shareholder interests (Maak and Pless 2006).

In a similar vein, Varma's (2020) examination of crisis management strategies within the responsibility compass revealed that it positively influenced the reputation capital of two major International airlines undergoing a crisis. This study also argued for the inclusion of *relational intelligence* in the responsibility compass (Coldwell et al. 2012). Relational intelligence, the combination of relational (ability to build and sustain trust in relationships), emotional (ability to understand other's reactions and adapt one's behavior appropriately), and ethical (ability to reflect on one's own and others values and norms to arrive at an ethically appropriate conclusion) abilities is focal to the Responsible

Leadership paradigm. It has also been observed that an understanding of public's emotional response and coping strategies during a crisis aids in the development of crisis communication strategies that help in rebuilding trust across stakeholders of an organization during a crisis (Varma 2018). Hence, the inclusion of relational intelligence in the responsibility compass would provide in-depth insights to the decision-making processes during a crisis.

### **Responsible Leadership and Crisis Management at the Macro Level**

Responsible Leadership research has advanced from a microlevel phenomenon with macrolevel outcomes to become associated with stakeholder identification, legitimacy, and salience. Today global leaders working in an interconnected world are challenged with reducing complexity and uncertainty while navigating through murky waters during a crisis. The viability of the organization and its long-term success depends on its leader to act responsibly toward all stakeholders and not just the shareholders (Maak and Pless 2006). Additionally, leaders need to be sensitive to the environmental and social responsibilities of the organization and the impact of their business decisions. This has resulted in a call by researchers to focus on developing leadership traits such as ethical literacy, global mindset, cultural intelligence, and community-building capabilities (Pless and Maak 2011).

In a study of the Canadian multinational corporation Talisman Energy which was charged with human rights violations due to its support of Sudanese military engaged in curtailing the freedom of civilians, Kobrin (2009) stated the responsibility for the misdeed lay with the TNC, even though the company's oil production operations were deemed successful and it contributed to the economic growth of the local communities (Kobrin 2009). Leaders of MNCs entrusted with significant economic and political power should exercise great caution when balancing the financial interests of shareholders with the corporate

and social responsibility of the host nation's local community, as there is a blurring of the line between the public and the private spheres. The legal and political systems and the geographical borders and jurisdictions (Kobrin 2009). Although the study was approached from a legal perspective, it is evident that the top management faltered while navigating the complex and ambiguous environment. Further research is, therefore, recommended to understand how enhanced sensitivity training to environmental and social responsibilities in a transnational environment impacts the practice of Responsible Leadership, vis-à-vis the most effective approach from among the four approaches as identified by Pless et al. (2012).

In a more recent study by Pless et al. (2021), in India, that investigated stakeholder conflict between a multinational corporation and the local Indigenous community that resulted in the loss of lives of three members of the Indigenous community Pless et al. (2021) concluded that an integrative approach was the morally superior choice in resolving the decade-long crisis based on Maak et al's. (2016) normative responsible leadership approaches-instrumental and integrative. While the Instrumental approach focuses on achieving organizational objectives, such as maximizing profits and interacting with key business stakeholders, for example, employees, government, and customers in a transactional manner to achieve business objectives (Pless et al. 2012), the integrative approach emphasizes value creation, and integrating business and societal objectives while engaging with a broad range of stakeholders in a collaborative manner. Stakeholder conflicts are steadily increasing worldwide (Banerjee 2018), highlighting the importance of engaging in responsible leadership research in the context of crisis management examining balancing of multiple competing and conflicting stakeholder interests. Additional research within the areas of crisis management and responsible leadership might examine cross-level linkages between micro-, meso-, and macro level to determine how it influences the practice of responsible leadership during a crisis.

## Conclusion

A crisis is “an unpredictable event that threatens important expectancies of stakeholders and can seriously impact an organization’s performance and generate negative outcomes” (Coombs 2007; p. 2–3); therefore, the manner in which it is managed is critical in the protection of an organization’s reputation and even its long-term survival. As crises vary by their types, severity of impact, and duration, future research within the areas of Responsible Leadership and crisis management should examine how these factors impact the practice of Responsible Leadership. The recent global pandemic should make this endeavor an urgent imperative.

## Role of Philosophy in Business Ethics

J. Angelo Corlett  
Philosophy & Ethics, San Diego State University,  
San Diego, CA, USA

## Introduction

The role of philosophy in business ethics is an especially appropriate subject because ethical inquiry has both its origin and developments within the domain of philosophy dating at least as far back to Plato’s Socrates’ inquiries into justice, the good, education, love, and politics. Insofar as business ethics is a species of the more

general field of ethics, and insofar as ethics originated and developed within the field of philosophy since the commencement of philosophy, it is especially appropriate to come to an understanding of some of the many ways in which philosophy might contribute to the further development of business ethics.

Insofar as the evolution of the field of business ethics in business circles is concerned, philosophy is especially well-suited to outline and detail the nature, function, and value of business ethics, normatively speaking. The field of contemporary business ethics seems to have begun in the 1960s as a subfield of applied ethics, again, within philosophy.<sup>1</sup> Yet it might be argued that its conceptual roots date back much further than that, perhaps even to the political philosophy of Karl Marx (Corlett 1998, 2013) and beyond. Despite the title of this article, its aim is to outline some of the many ways in which the field of philosophy might contribute to the field of business ethics. This article is intended to serve as a propaedeutic to a more comprehensive treatment of the subject.

I shall begin with a concise definition of “business ethics,” along with the description of the normative function and value of business ethics. Subsequently, I shall delineate various ways in which philosophy can and ought to contribute to the field of business ethics.

## Defining “Business Ethics”

“Business ethics” is that field of interdisciplinary academic study which provides qualitative and quantitative analyses of a wide array of ethical problems, both descriptively and normatively, related to the business enterprise. It is both empirical and conceptual in that it must often gain from business studies, history, and the sciences data about which to provide normative philosophical

arguments regarding how business ought to be best conducted. This definition is wide enough to include virtually every business domain of ethical inquiry, from management to advertising, from hiring to employee compensation and benefits. Indeed, the field of business ethics has evolved since its inception and is perceived by increasing numbers of philosophers as being respectable, so much so that recent years has witnessed the publication of an increasing number of works on business ethics containing articles composed by numerous well-respected philosopher-ethicists writing on a wide range of topics in the field: from methodological/theoretical investigations to issues of corporate responsibility, punishment, and compensation, from economic justice to consumer rights, from issues of business globalization to those of privacy, from corporate influences on politics to affirmative action and racism in the business workplace, and to environmental problems and business enterprises (Brenkert and Beauchamp 2010; Luetge 2013; Poff and Michalos 2019).

## Some of the Roles of Philosophy in Business Ethics

With a basic understanding of the nature of the field of business ethics in mind, what are some of the roles of philosophy in business ethics? Philosophy has not just one role, but many roles to play in the field of business ethics. *One role of philosophy in business ethics is to clarify the nature, function, and value of normative ethics in general:* What is it? What does and ought it to do? Why is it valuable both in general and for business ethics in particular?

If normative ethics is the philosophical analysis of various key categories pertaining to the moral life and how it ought to be lived, and why, various theories of ethics ought to be explored and critically assessed philosophically concerning their plausibility in order to discern which one is most plausible and useful for business ethics considerations. The reason for this is provided by Plato’s Socrates, namely, so that we can be better for the rest of our lives. Herein is the main value of

<sup>1</sup> The *Journal of Business Ethics* was founded in 1982 by philosophers Alex C. Michalos and Deborah C. Poff who served as its esteemed editors for decades and established it as the finest and most long-standing journal in the general field of business ethics. The contents of this journal helped to shape the field of business ethics until this very day.

normative ethics in general. In this respect, then, business ethics is fundamentally philosophical. For *philosophy can assist the field of business ethics in discovering its conceptual foundations and keeping it on track with sound reasoning so that business efforts can be ethically optimized both qualitatively and quantitatively.*

### Why Is Business Ethics Important?

Of all of the several subfields of ethics, what is the importance of *business* ethics? Business ethics finds its significance at least in part in its ability to serve as the domain of study which concentrates its efforts on matters of fundamental concern for anything business-related. Insofar as it is wise to have a discipline devoted chiefly to a field of serious concern and its attending difficulties, it behooves us to create and, having created, to nurture business ethics as a discipline devoted to the critical ethical inquiry into anything pertinent to business. Fundamentally, business ethics serves the function of keeping business normative in the sense that whatever problems arise in business that have ethical importance, they are addressed and (hopefully) resolved according to how said problems ought to be resolved, all relevant things considered. By “ought to be resolved” and “all relevant things considered,” it is meant that economic considerations, for example, should not be construed as being the only or most important ones when addressing business concerns. For there are extra-economic considerations that may sometimes trump considerations of economics and competitive viability, ones that are based, for instance, on ethical principles or the principles of a morally enlightened conscience. For example, it is one thing to have an economically successful business but one wherein the employees have few, if any, protections against workplace abuses. Yet it is quite another to have an economically successful one wherein its employees are well treated and well paid. The very idea of trade-offs in discussions of business matters introduces business ethics. And since it does, it behooves those in business to seek out the very best that ethics has to offer, and sometimes this requires delving

deeply into the realm of ethical theory wherein at the roots of certain business practices and ideas lie implausible ethical theories. To ignore the normative demands of ethics is as unreasonable as ignoring the economic factors of business. The field of business ethics must take seriously a holistic range of factors relevant to the business enterprise while disallowing the favoring of one kind of factor over others without adequate justification thereof.

Furthermore, the complex nature of business ought to make business ethics multi- and interdisciplinary. For it is dubious to think that the complex problems of business can be completely solved by or within any particular discipline such as philosophy. For most philosophers, as academicians, lack the training and experience in business that would enable them to adequately address such matters without assistance from experts in business, history, organizational psychology, sociology, etc. But philosophy, as the originator and keeper of ethics, has a special role or set of roles to play in contributing expert insights on how ethics can best inform our business inquiries. And it can do so by way of its primary method of conceptual analysis and argumentation.

Secondly, *philosophy should outline and examine the scope of business ethics in general terms*, recognizing that there is welcomed room for more narrowly focused studies of business ethics. But it should outline the scope of the field in an inter- and multidisciplinary manner, though it is surely desirable that more restrictive definitions of “business ethics” might be useful from discipline to discipline and within each such discipline so long as we are careful to clarify the respective aims of our business ethical inquiries in order to avoid confusion, hence the title of this article: “The Role of Philosophy in Business Ethics.” Alternatively, a historian might contribute her insights on “The Role of History in Business Ethics,” or an experimental social cognitive psychologist might contribute her insights on “The Role of Experimental Social Cognitive Psychology in Business Ethics,” etc. There is plenty of room for a wide variety of such contributions.

I shall ignore details of what I consider an ill-conceived distinction among many philosophers between theoretical and applied ethics. That distinction need not concern us here. Assuming that the distinction has any merit, I would think that business ethics should span the range of theoretical and applied ethical issues. For applied ethics which is not grounded in solid ethical theory is bound to be shallow and riddled with problems endemic to the ethical theory that has been uncritically presumed or adopted by a particular standpoint in business ethics. Furthermore, an ethical theorist should consider applied ethics to be a fertile testing ground for the plausibility of all ethical theories.

Normatively speaking, the field of business ethics includes the description and assessment of various theoretical approaches to business ethics: relativism, subjectivism, utilitarianism, deontologism, virtue ethics, etc. However, it ought also to include the description and assessment of various practical problems of a business nature: What makes for an ethically good business? In more general terms, philosophy ought to assist business ethics in posing and answering this and related questions, as well as to provide a multi- and interdisciplinary attempt to state the general role of business in society, a task that should be ongoing given that times change and require new approaches to addressing business issues and given that human knowledge concerning business evolves and requires the updating of what is taught and learned.

### **Some Additional Areas of Ethics Where Philosophy Can and Ought to Contribute to Business Ethics**

There are additional areas in which philosophy can and ought to contribute to the development of the field of business ethics. They include the subjects of rights, responsibility, punishment, compensation, racism, and environmental matters. In these areas of business ethics, *philosophy may contribute from excellent work in philosophy of law, social and political philosophy, philosophy of racism, and the ethics of environmentalism, for*

*instance.* In so doing, philosophy would do well to contribute certain aspects of John Rawls' celebrated political philosophy as it is insightful especially for its emphasis on the separateness of persons and rights over social utility considerations (Rawls 1971: 3–5) and the original position thought experiment designed to devise the fair selection of principles of justice for both domestic and global societies (Rawls 1971, 1999). Rawls' work on global justice (Rawls 1999) is particularly important given that during the past few decades, increasing numbers of businesses enterprises have become global institutions (Ruggie 2013). For it can, among other things, contribute a plausible method by which to fairly select principles of justice which might govern transnational businesses. And it is the selection of such principles which becomes the sticking point of concern between those who favor a human rights approach to domestic and globalized business and those who favor a free market business model of the same (Ruggie 2013). *Whatever else philosophy might contribute to the field of business ethics, it can, as it clarifies many of the problem areas of ethical theories which tend to underlie various approaches to business ethics, provide a conceptual foundation on which to fairly and reasonably resolve disputes within business ethics especially with regard to rights, responsibility, and remedies for business malfeasance.*

However, even if philosophy is able to assist the field of business ethics in devising reasonable and ethically optimal policies with regard to rights protections, it is quite another matter indeed to devise viable enforcement mechanisms in light of state's reluctance, for fear of losing businesses and the adverse economic implications for state's economies thereto, to enforce such rights-based norms. And if it is left to businesses themselves to abide by said norms, it is unlikely to occur given that it is often not in their best economic interests to do so and thus they face the obstacle of not performing their respective fiduciary duties to their stockholders and dependent subsidiary businesses. Philosophy, especially social and political philosophy, must find ways to contribute to this seemingly intractable practical problem.

Must businesses, national or transnational, be forced by state and international laws to comply with said norms by significant penalties for non-compliance? And if so, what is the likelihood of this happening given the competition of states each with their struggling economic interests to lower standards of compliance in order to attract businesses in order to enhance their economies and standards of living? But if left to the invisible hand of business enterprises, history tells the story of repeated rights violations having long-standing adverse impacts on human development and the nonhuman natural environment. Moral, legal, social, and political philosophy must contribute to this discussion in hopes that they can resolve the problems therein. As one writer puts it: “Creating a more *just* business in relation to human rights involves finding ways to make respecting rights an integral part of business – that is, just making it standard business practice” (Ruggie 2013: xxiv). Among other things, this involves moving beyond the standard corporate social responsibility initiatives invented for the most part from within business communities often in order to appease their actual or potential customers to a more robust business ethic which embraces a transformative model of doing business wherein ethics, not self-serving business mores, are employed in order to serve local and global communities as well as the legitimate economic interests of businesses themselves. On the other hand, advocates of human rights often communicate their views as if human rights are absolute in nature, admitting of no exceptions under any circumstance. But if Joel Feinberg has taught us one thing about human rights, it is that there cannot be a human right which is *absolute* of which there is short supply and high demand (Feinberg 1980). Perhaps he has in mind the “‘ought’ implies ‘can’” ethical dictum wherein one cannot have a duty to X if one cannot perform X and one cannot have a right to X if X does not exist. In any case, human rights talk must comport with solid rights theory, and this includes the elimination of the proliferation of rights where there indeed none at all, especially pertaining to certain alleged human rights violations caused by businesses. Not many rights, if any at all, are

absolute and impose an absolute duty of others to not interfere with the exercise or enjoyment of said right. Human rights advocates must steer clear of such imprecision if genuine progress is to be made with respect to respecting rights in the contexts of business. *Moral, legal, social, and political philosophy can and should assist the field of business ethics in clearly analyzing the concepts of rights (and their correlative duties) so that confusion is avoided.*

## Rights

One major issue in business ethics is the extent to which domestic or transnational business enterprises have rights to acquire land and minerals on or in them without having to pay compensation to those who possess rights to said lands. While this problem is often couched in terms of multinational businesses acquiring lands from indigenous peoples without compensating the indigenous peoples for such lands (Ruggie 2013: xv–xvi, xxxvi–xlii, Chap. 1), the problem has important historical roots, such as the genocidal theft of indigenous lands by various European invaders, leading to the morally problematic acquisition of such lands by various businesses even today in what are called the Americas (Corlett 2003: Chaps. 8 and 9, 2010).

However, the matter raised in the previous paragraph is parasitic on the matter of the possession of rights themselves. For surely if persons have rights, then others, including businesses, generally have duties to refrain from the interference of right holders’ exercise or enjoyment of such rights. This would also imply that rights violators must be punished for and compensate their victims. Thus, my right to X, when violated by business Y, imposes on Y a compensatory duty toward me and sometimes a duty of the state to punish Y. But this raises the question as to the nature and value of rights. Some believe that rights, even human rights, are merely social constructs such that one has a right to the extent that the institution of the law recognizes such rights. Yet this view of the nature of rights and especially human rights does not comport with the manner in which human rights are construed by the vast majority of those who consider themselves to

believe in rights in general and human rights in particular (Corlett 2009; 2016).

Feinberg recognizes at least two general kinds of rights. Institutional rights are those which are socially constructed and recognized, say, by a system of legal rules. But noninstitutional rights are the ones which are discovered by reason and the principles of an enlightened moral conscience and may or may not be recognized by law. Thus, one may have a legal right to X to the extent that a legal system recognizes such a right. But one might also have a moral right to X whether or not one has a legal right to X. Saying that one has a moral right to X often means that one ought to have a legal right to the same, that is, that the legal system ought to recognize and respect such a right<sup>2</sup> (Feinberg 1973, 1980, 1992; also see Thomson 1992). Contrary to some others, then, a human right, if it exists, is a species of a moral right and is one that the law ought to recognize and respect. To deny that someone has a right to X simply because she has no legal right to X only denies that said right exists in the relevant legal system. But it hardly answers the question of whether or not she should have said right recognized and respected by law. One must delve deeper given the logic of rights and duties in order to discover what the balance of human reason reveals concerning who has which rights, and why, and which duties, if any, are correlated with such rights and why. *Philosophers of law and rights can and ought to contribute expertise in this way in order to avoid conceptual confusion in both insisting that businesses ought to have unfettered reign over their activities, on the one hand, and insisting that there is a human right wherein there is no such right, on the other.* Surely where there are significant rights violations by businesses, there must be reasonable legal remedies based on a system of legal rights, responsibility, punishment, and compensation.

## Responsibility

There is a growing philosophical literature on collective responsibility. One of the seminal contributions to the field is that of Feinberg's on collective responsibility (Feinberg 1970: Chap. 8). His is primarily an analysis of collective legal responsibility, while other analyses have centered on collective moral responsibility<sup>3</sup> (Corlett 2014: Chap. 10). Additionally, there is a plethora of work on individual moral responsibility<sup>4</sup> (Fischer and Ravizza 1988).

Collective responsibility theory is particularly pertinent to the field of business ethics because of the problems associated with corporate responsibility. Whether it is the issue of whether or not there is a moral foundation for or any other legitimate justification for the legal doctrine (in US business law) of corporate limited liability or whether it is the problems concerning the extent to which businesses themselves should be viewed as being possibly liable agents, that is, subject to responsibility by law, the concept of collective responsibility plays an essential role in providing reasons why or why not this ought to be the case. *So it is important that philosophers of law who specialize in collective responsibility theory contribute their expertise to this particular area of business ethics which emphasizes corporate responsibility.*

Furthermore, not only is collective responsibility theory related to the field of business ethics and is important for philosophy to contribute its expertise to the field of business ethics accordingly, so is individual moral responsibility theory important in a similar manner. *Whichever is the most plausible theory of individual moral responsibility ought to be used in order to address problems*

R

<sup>2</sup> Amartya Sen refers to these rights as "laws in waiting" (Sen 2009).

<sup>3</sup> Philosophical work on collective moral responsibility as it pertains to remedial rights to compensatory and non-compensatory reparations includes Corlett (2010: Chap. 5) and McGary (1999: Chap. 5).

<sup>4</sup> Several articles authored by the world's leading philosopher-experts on the topic of moral responsibility are published in *The Journal of Ethics: An International Philosophical Review* (Springer).

*regarding the complexities of the business environment in terms of under which circumstances ought business agents to be held accountable and punished for harmful wrongdoings they commit qua business agents.*

### **Punishment and Compensation**

When it comes to corporate responsibility and punishment, important conceptual developments have also been made. One suggested method of corporate-collective punishment, the “Hester Prynne Sanction,”<sup>5</sup> suggests that businesses duly found guilty to significant harmful wrongdoing ought to be forced by court order to pay a third-party advertiser to adversely publicize that guilty businesses’ wrongdoing within the confines of the court order (French 1984). While this particular mode of punishing malfeasant businesses is problematic because it is insufficient punishment for business harmful wrongdoings of a most serious nature [e.g., the Union Carbide (now Dow Chemical Company) toxic chemical leak in Bhopal, India; the Exxon Valdez oil spill in Prince William Sound, Alaska], thereby violating plausible principles of proportionate punishment (Corlett 2014: Chap. 11), it serves well for a punishment for lesser business wrongdoings (Corlett 2014: Chap. 11). Moreover, the adverse publicity sanction might be coupled with fines and the piercing of the corporate veil in order to punish those business agents most guilty of the wrongdoings in question, extracting as much business-individual assets as possible in order to force such liable agents to pay compensation to those they have harmed most. Of course, this poses a challenge to the US doctrine of corporate limited liability. Yet this is *one more important way in which philosophy can and should contribute to the field of business ethics, by serving as a reasonable challenge to certain presumed values and policies*. If corporate-limited liability exists in that it is feared that business could not function without such personal protections, it might just as

reasonably be argued that the adoption of laws supporting unlimited corporate liability for business agents would disincentivize business agents to act as irresponsibly as many often do and furthermore reward only fair and just business practices. *Philosophy, especially ethics, can and should contribute such insights to the field of business ethics where all too often status quo business practices (often inspired by utilitarian considerations about the greater good instead of or absent adequate regard for considerations of rights protections) are presumed to be “innocent until proven guilty.”* Yet such an attitude seems to thwart the very point of business ethics insofar as it appears to presume that matters of business ought to precede those of ethics.

### **Racism and Affirmative Action in Business**

Quite important is the matter of general access to business. And perhaps there has been no greater moral and legal issue along these lines than affirmative action. Several philosophers have contributed to the ethics of affirmative action over the past half-century (Boxill 1984; Corlett 2003: Chap. 7, 2010: Chap. 10; McGary 1999), and they have sought to provide sound moral arguments for and against the policy of requiring/incentivizing businesses to employ persons based on preferential treatment considerations motivated by ethnicity and gender. Perhaps even more can be argued along these lines in order to become clearer about the role that racism plays in the business workplace. Whether it is racism from employer to employee, from employee to employer, or from employer to another employer, racism has played an important role in many businesses for generations. This is why many believe that policies must be set and remain in place in order to combat racism which often prohibits victims of racism from performing well in the workplace – or from even being hired in the first place. *Philosophers of racism can and should contribute to the field of business ethics by providing clear and reasonable analyses of the nature and function of racism and how it might be reasonably addressed in the business environment.*

<sup>5</sup> It is also referred to as the “adverse publicity sanction” in Corlett (2014: Chap. 11).

## Businesses and Environmental Concerns

As it does little good to address matters of racial injustice in the business workplace without also addressing problems of environmental viability, the latter concerns are also essential for the field of business ethics to resolve. What good does it do to resolve matters of racism if the very environment in which people seek to live reasonably good lives is on the brink of environmental decay [due, no less, to such business disasters as the Union Carbide (now Dow Chemical Company) incident in Bhopal, India, and the Exxon Valdez oil spill in Prince William Sound, Alaska]? Philosophy can and should contribute to the field of business ethics by providing theories and arguments for and against those theories of environmental ethics.

## Conclusion

In conclusion, I have delineated a partial account of the role that philosophy can and should play in the field of business ethics, opting for an approach that takes rights, responsibility, punishment, compensation, racism, and environmentalism seriously. No doubt there are other roles for philosophy to play. For instance, philosophy can delineate ways in which sexism can and does arise in business and how it might be effectively addressed. I hope that I have provided a philosophical propaedeutic for a fruitful discussion of what business ethics is and ought to be and why.

## Seed Banks

Michael Way  
Conservation Science Department, Millennium  
Seed Bank, Royal Botanic Gardens Kew,  
Ardingly, West Sussex, UK

## Synonyms

Germplasm bank; Seed gene bank

## Introduction: The Role of Seed Banks

A seed bank is a documented collection of seeds held for long-term security or for ease of access. It is one of the oldest forms of gene bank, where genetic material essential for agriculture, forestry, or plant conservation is preserved, curated, and made available to user communities from off-site (ex situ) storage conditions.

All seed banks aim to acquire and maintain seed of high quality that will provide users with viable genetic material that represents the variation and useful traits of the original field collection. Such genetic materials of actual or potential value are termed “genetic resources.” In the field, plant species are continually evolving in response to selection pressures acting on them. This process is largely halted for a seed collection that is brought into a seed bank for long-term preservation, but the samples of genetic diversity held in

seed banks are increasingly important for two reasons.

Firstly, seed banks safeguard genetic diversity that is at risk at the population and species levels. Given the current rate of loss and deterioration of habitats and the increasing impact of climate and environmental change, it is estimated that more than 20% of wild plant species are threatened with extinction, and seed is the preferred material for genetic resource preservation. Seed banks also play a critical role in preserving agricultural genetic material that is at risk of loss, as locally distinct crop varieties and landraces have been overtaken by higher-yielding varieties.

Secondly, seed banks are reliable and convenient sources of genetic material for users as they provide well-identified seed samples of known origin and viability, at little or no cost to researchers. An additional benefit is that material is supplied under clear terms and conditions, as a result of prior negotiations with providers and source country authorities, which have anticipated the likely uses for this material. This enables users to immediately document any restrictions on use, then accession, propagate, and study the material.

The majority of plant species can be seed banked for at least 50 years, but research is continually striving to extend the taxonomic range of species that can be preserved and to maximize life span in storage. Seed banks manage the risk of loss or deterioration of a collection by periodic monitoring of seed viability following agreed technical standards and by duplication of part of

each collection at another facility, occasionally as a “black box” which will not be opened without the owner’s consent. Seed banks cooperate with other gene banks to facilitate the preservation of pollen, DNA, and tissue samples and often work closely with taxonomists and horticulturalists to ensure that collections are correctly named and characterized and to develop and share cultivation knowledge.

In addition to their core functions of curating and supplying seed collections to users, seed banks may participate in the collection of seed from field (in situ) conditions, in research on the preservation or use of the material, in regeneration and characterization of the collections, and in sharing seed preservation skills and germination knowledge with stakeholders. They may advise on policy development, such as through the intergovernmental scientific advisory body known as the Subsidiary Body on Scientific, Technical and Technological Advice (SBSTTA) that develops specialist advice to the Conference of the Parties of the CBD, and they may also help disseminate best practice to the wider community, through participation in initiatives such as the Principles on Access to Genetic Resources and Benefit-Sharing developed by 28 botanic gardens and herbaria in 2000.

## International Seed Bank Networks

From their origins as simple stores for crop seed, seed banks have diversified and expanded to hold priority genetic resources for communities, for industry, and for government agriculture and forestry programs. The massive scale of seed collections being curated both safeguards genetic resources at risk of loss in the field and also provides essential material to help future generations adapt to environmental and technological changes. For example, the Genesys portal provides information on more than 3.6 million collections held in over 400 crop gene banks (Genesys 2018).

Seed banks have been established within botanic gardens, initially to support seed exchange and horticulture, but now over 400 of these are banking seed for plant conservation

(BGCI 2018). The Millennium Seed Bank Partnership coordinates organizations in over 100 countries and territories to collect and bank seed from threatened and useful plant species, including crop wild relatives, using common standards (RBG Kew 2018). Initiatives such as these work across international borders in order to conserve genetic diversity for future generations; to make it available for research, education, or cultivation; and to share data on the availability of collections. These *ex situ* collections are not a substitute for conservation of biodiversity *in situ*. Rather, they complement *in situ* conservation by mitigating against the loss of this biodiversity in the field and by facilitating the sustainable use and the sharing of benefits from utilization of the material, directly in support of the objectives of the Convention on Biological Diversity (CBD).

## Access and Benefit Sharing

Seed banks function as trusted intermediaries in the acquisition and supply of genetic resources to users. At an international level, two legal instruments currently provide the framework for access to genetic resources and the fair and equitable sharing of benefits arising from their utilization (ABS): firstly the Nagoya Protocol to the CBD and secondly the International Treaty on Plant Genetic Resources for Food and Agriculture (PGRFA). Seed banks have obligations under one or both of these instruments, according to their institutional governance and their focus on either wild genetic resources or PGRFA.

### The Nagoya Protocol to the Convention on Biological Diversity (CBD)

Prior to 1993, researchers seeking access to biodiversity from a source country would typically apply for research and/or collecting permits from a government wildlife body, landowner, or protected area manager and would accept conditions to share data and skills with appropriate counterpart organizations and to deposit one set of specimens in appropriate national collections. As a result of either the absence or weak enforcement of regulations in many source countries at that

time, the ability of countries to receive further benefits such as royalties from any subsequent discovery and commercialization of products from genetic resources was poor, and sectors of society that had maintained biodiversity in situ were receiving little, if any, compensation.

The CBD, agreed at the Rio Earth Summit in 1992 and which entered into force in 1993, aimed to provide a new global framework with three objectives, firstly the conservation of biological diversity, secondly the sustainable use of its components, and thirdly the fair and equitable sharing of the benefits arising out of the utilization of genetic resources. In this third objective, the negotiators sought to balance the interests of typically biodiverse provider nations with the interests of less biodiverse industrialized user nations. The CBD establishes that parties have national sovereignty over access to genetic resources, that mutually agreed terms and prior informed consent (PIC) is required from the provider country, and that benefits must be shared. The CBD is not a static convention, but a process that has enabled parties to make important improvements in management of biodiversity, for example, through strategic planning and sharing of biodiversity information for decision-making. However there have been difficulties for many party countries to develop the required national access legislation to implement access and benefit sharing.

The Nagoya Protocol on Access to Genetic Resources and the Fair And Equitable Sharing of Benefits Arising from Their Utilization (the Protocol) was agreed in 2010 at the tenth meeting of the parties to the CBD (Secretariat of the CBD 2011). On its entry into force in 2014, parties have clearer obligations: they must introduce compliance procedures to monitor the utilization of genetic resources, for example, by establishing checkpoints to record compliance with the Protocol. If parties introduce access legislation, the Protocol sets out clear procedures for access to genetic resources and benefit sharing. Seed banks can refer to the ABS Clearing-house website (Secretariat of the CBD 2016) to clarify legislation and procedures to be followed. To fulfil their obligations, seed banks need to hold sufficient information specifying the source of the seed collection,

the identity of the provider(s) of genetic resources to them, and the permit, agreement, or other forms of PIC that are associated with the collection, plus the nature of any restrictions on use or supply of the material and details of any benefit sharing that may have been agreed and implemented. The tracking of this documentation is not purely an administrative matter, as by enabling transparency and building confidence between providers and users of genetic resources, it directly upholds and supports the conservation and sustainable use objectives of the CBD.

### **Traditional Knowledge Associated with Genetic Resources**

The CBD established in its article 8j the rights of “indigenous and local communities embodying traditional lifestyles” to share in the benefits arising from utilization of genetic resources. The fact that genetic resources and associated knowledge are treated in the CBD in part in a utilitarian manner, to be exchanged between providers and users, contrasts with the more holistic worldview often held by local and indigenous communities, as has been documented, for example, by representatives of Canadian aboriginal communities in the Iskenisk Declaration (2011) on the Access, Use, and Fair and Equitable Sharing of Benefits Arising Out of the Utilization of Genetic Resources and Associated Traditional Knowledge in Canada.

The Protocol has strengthened the rights of such communities to “benefit from the use of their knowledge, innovations and practices,” and seed banks will need to improve engagement with local communities to ensure that their rights are upheld. In practice, this means that collectors for seed banks may tend to invest in a small number of community relationships where trust exists and pathways for benefit sharing have been established. Guidance on procedures is available from the International Society of Ethnobiology’s Code of Ethics (2006) and the sectoral and individual codes and guidelines published on the CBD’s Access and Benefit-sharing Clearing-house which is a platform for exchanging information on ABS. The wider global framework to promote the dignity and well-being of indigenous

communities is provided by the 2007 UN Declaration on Rights of Indigenous Peoples.

### **Change of Use of Genetic Resources**

Seed collections acquired under national legislation with consent for a specific non-commercial research activity, e.g., plant taxonomy, may also contain untapped genetic resources that would be valuable for other uses, e.g., for biochemical screening or horticulture. To maintain transparency and trust between providers and users of genetic resources, mediated by seed banks, it is vital for users to clearly recognize and document the restrictions on use that apply to material in their care. In the event that a user proposes to initiate work outside the terms of the original access conditions, the seed bank and/or the proposed user need to request PIC from the original provider and/or competent authority.

### **The International Treaty on Plant Genetic Resources for Food and Agriculture**

Plant genetic resources for food and agriculture (PGRFA) were recognized by FAO in 1983 in the International Undertaking on PGRFA as “a heritage of mankind to be preserved, and to be freely available for use, for the benefit of present and future generations.” This position reflects the fact that crop germplasm has been exchanged, traded, and improved by farmers over millennia and also the fact that modern high-yielding crop varieties may include germplasm from multiple origins.

In June 2004, the International Treaty for PGRFA (IT) entered into force (FAO 2009), with the objective of the conservation and sustainable use of plant genetic resources for food and agriculture and the fair and equitable sharing of the benefits arising out of their use, in harmony with the CBD, for sustainable agriculture and food security. The IT specifically recognized the contribution made by farmers to the conservation and development of PGRFA by requiring parties to take measures to protect and promote farmers’ rights, including the protection of traditional knowledge, the sharing of benefits from utilization of PGRFA, and the participation in decision-making at the national level about PGRFA.

The IT established a multilateral system (MLS) for access and benefit sharing of PGRFA, covering 35 major food crops and 29 forage crops listed in Annex 1 to the IT (FAO 2009). The seed bank collections of the International Agricultural Research Centers (IARCs) also became part of the MLS, and seed banks managed by party countries that access or supply genetic resources of Annex 1 crops for the purposes of food and agriculture are now obliged to use a standard material transfer agreement (sMTA) and adhere to the terms of the IT.

### **The Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES)**

CITES entered into force in 1975 with the aim to ensure that international trade in wildlife and their products does not threaten their survival. With more than 180 parties to the Convention, seed banks need to adhere to the import, export, and reporting requirements of the Convention whenever material within the listed appendices is moved from one party country to another, whether for trade or for non-commercial purposes. National authorities assess the potential impact on conservation status of listed species before granting import and export CITES permits. A system of CITES-registered institutions enables leading scientific institutions in each country to simply use reference labels for exchange of listed material.

### **Biosecurity and Plant Health**

A seed collection may inadvertently contain pests or diseases of potential harm to agriculture, forestry, or native habitats, and seed banks can provide vital samples of well-identified material which can be used in screening to understand and respond to these potential threats. It is important that seed collections are collected in the field and provided to the seed bank as clean and free from debris as possible and that requirements of plant health inspectors are followed for any

material controlled under plant health regulations. Seed banks that handle controlled seed or plants use quarantine procedures to minimize the risk of cross-contamination or release of high-risk material. Equally, when responding to requests for samples from controlled collections, seed banks need to ensure that users are aware of their responsibilities to prevent escape of pathogens or invasive species from their facility, typically by containing any material and destroying high-risk material at the end of their research.

## Self and the Generalized Other

Antony J. Puddephatt

Department of Sociology, Lakehead University,  
Thunder Bay, ON, Canada

## Synonyms

Selfhood; Social identity

## Introduction

George Herbert Mead's (1934) social conception of self has become the most important model in Sociology for theorizing the relationship between the individual and society. Mead's importance as a sociological theorist is eclipsed only by Emile Durkheim, Max Weber, and Karl Marx, and he is heralded as the most important sociological social psychologist. By examining how Mead conceives of the self as a socially constituted phenomena, in constant interplay with the imagined expectations of "generalized others," we begin to understand the key aspects of his social psychology. After establishing this, its relevance for organizational and business ethics is considered.

Mead recognized, like Hegel before him, that the self is a dialogical product of the social and linguistic community that individuals inhabit. Yet unlike Hegel, and closer to the evolutionist philosophy of Charles Darwin, Mead located self-development as a continual process that happens within the material fabric of everyday life, within the concrete immediacy of social interaction in physical time and space (Mead 1936). The individual self is not given at birth, and cannot be explained by recourse to biological explanations alone, as often assumed in various models put forth in psychology and classical economics. For Mead, the self evolves through the internalization of social actions, most efficiently through the use of language, over the course of a lifetime. The mind and self evolve as a microcosm of the wider community dynamics within which

individuals grow and develop. The nature of the community and its social structure is thus greatly important for the growth and development of selves, which always reflect the nature of the communities out of which they emerge.

Mead (1934) begins by considering the distinct nature of the human mind, a logical precursor to the development of self. Mead argues that human beings are unique from other animals because they have the capacity for symbolization and use this capacity to enable thinking and social action. For example, when dogs fight, Mead posited that they merely react to one another through a stimulus-response pattern, operating primarily on instinct. Humans, on the other hand, have the capacity to take the role of the other combatant, and imagine, through a process of self-communication, what lines of attack and defense might be best given the expectations of the other. Unlike nonhuman animals, people are able to capture complex actions with symbols and advanced language, enabling new forms of intelligence to be possible.

An important aspect of this reflective intelligence is the ability for actors to imaginatively “take the role of the other,” to try and interpret expectations from their point of view. This is handled by first observing, and being a part of, linguistically enabled social relations. Thought is simply the internalization of these social conversations over time into individually centered, minded behavior. Intelligence, for Mead, is the internalized use of language to play out possible lines of action before they happen, in an effort to choose the best path. The more intricate patterns of thought we observe in the community, and the more precise our language systems, the better and more sophisticated we are able to think. Language is conceived as the crucial medium of thought. As we cannot swim without water, Mead argued we cannot think at a human level without the aid language in the inner space of mind, which is seen as self-communication.

This leads to Mead’s discussion of the inner dialectic of the “I” and the “me” that makes up the self through interaction. In this way, the self is defined by its ability to be both a subject and object at the same time. The “me” is the

symbolized self that is experienced as an object, generated from the imagined viewpoint of others. By gaining these images from others over time, actors are able to build a self-concept that is relatively stable. In contrast to the “me,” the “I” is the unpredictable side of the self, a subjective response to the emergent definitions of the “me” that arise through social experience. The “I” operates in the “knife-edge” present, generating impulses as a reaction to biological impulse and the physical reality of the situation, but also the imagined responses of others that shape the “me.” It is the ongoing dialogue of the impulsive, subjective “I,” as it responds to the socialized and objectified “me” taken from the community, which makes up the unique character of individual thought and action in human group life.

Since the self is a product of language and immersion in the social patterns of the group, it is by nature not a given, but a product of ongoing development. As such, Mead conceived two main phases of childhood development in which the self takes shape, including the “play” stage and later, the “game” stage. In the play stage, children learn to take the role of others. Games like “cops and robbers” and “playing house” allow for the creative playing out of roles they see in the adult world. They are able to explore what it would be like to be a mother, or a police officer, and handle their associated responsibilities. But further, they are able to play out the essential skills of “taking the role of the other” through interaction. The “mother” must put herself in the shoes of her children who need help, and the “cop” must try and take the role of the robber if they are able to successfully catch them. It becomes clear at this phase of play that roles require certain formal responsibilities, but to perform these well requires the crucial ability to put oneself in the others’ shoes, since individual roles always tend to play out in relation to and in tune with others.

After having moved through the play stage, children are able to proceed to the game stage of self-development. Mead uses the example of baseball to illustrate what this entails. In a baseball game, there are nine fielders, all playing different positions, each carrying slightly different roles and responsibilities. When a player has to respond

to a situation on the field, their actions must be integrated with the rest of the team. Yet it is too much for the individual player to take stock of every other player, and all of their positions and varied roles, in calculating the best play. Instead of this, the player simply takes on the imagined perspective of the generalized “team” as a whole. This is what is known as learning to take the role of the “generalized other” in social conduct. Instead of only taking on the role of other individual selves, actors must now learn to be able to conceive of preferred lines of conduct from the perspective of wider teams, groups, organizations, and communities and even larger and more abstract social entities, such as nation-states or global communities.

The “generalized other” is thus a source of social control over the individual, as actors learn to adjust to wider community norms, values, and expectations. As such, the “game” stage is an essential process of development for the self. It is only through this stage that actors can learn how to operate within complex organizations and bureaucratic structures, where it would be impossible to know or try to imagine the aggregate wishes of many hundreds or thousands of others at once. It is vital to social development that people can learn to understand and then operate under the auspices of what organizations and institutions expect of them.

This provides an image of Mead’s self that would render it flexibly adaptive to institutional structures and, hence, quite subject to organizational controls. Yet Mead always emphasized the creative interplay between the self and the surrounding community (or business organization), such that each are seen to influence the development of the other. Mead saw the relationship of self and community as a continual, dialogical, and mutually affecting one. Individuals have the ability to see institutional directives in unique ways based on their own unique histories and meanings. Further, the “I,” as previously discussed, guarantees an element of novelty and unpredictability in how individuals react to their institutional surroundings. As a result, they have the ability, and perhaps moral duty, to try and reshape

institutional structures as they naturally act within and toward them.

This obligation to democratically shape institutions alongside of others has implications for ethics (Mead 1923). First, individuals can strive to reject or counter organizational aims if they conflict with their own meanings, values, and beliefs. Indeed, to act ethically within an organization requires a certain consistency between what the organization demands and what the individual acting within it feels is morally acceptable. In the other direction, connections to wider communities and organizations have the ability to enhance one’s own personal ethical capacity. A church group, for example, might alert people to the needs of those in hunger or poverty; an environmental organization might instill the importance of an ecological vision that considers the effects of pollution on nature; and a bank may instill in their employees the importance of client protections and informed consent. Mead believed that our morality expands to the degree at which it takes ever-expanding circles of others into account. Corporations and businesses, as complex human organizations, have the ability to do this very thing, awakening an awareness of, and hence accommodation toward, diverse others. Actors have the ability to collectively shape the ethical protocols of such organizations, while the latter can shape the ethical capacities of those individuals who comprise them.

## Sen, Amartya

Sanjit Chakraborty  
Indian Institute of Science Education and  
Research Kolkata, Mohanpur, WB, India

## Synonyms

Agency freedom; Amartya Sen; Capability approach; Choice; Normativity; Welfare economics; Well-Being

## Introduction

Amartya Sen's remarkable endeavor to realize the normative capability of welfare economics goes beyond the impecunious resultants of the neoclassical welfare economy. The neoclassical welfare economy decoratively bracketed values to speculate about factual observations. This was due to the influence of logical positivists and their convictions about experimental scientific statements (primarily mathematical) and their vicinity to empirical truths and analytic statements. Sen adequately inquires "whether morality can be expressed in the form of choice between preference patterns rather than between actions" (Sen 1997a, 78).

"A new phase classical theory" in economics from the hands of Sen and some others put forth two pivotal issues in a unified manner:

- (a) Mathematical models of an economy
- (b) Ethical reflection on the subject of welfare economy – a value-laden enterprise in Sen's literature

In general, welfarists and utilitarians affirm that moral values are anchored in individual agency and involve mental metric utilities (pleasure, happiness, pain, etc.). This focus, first of all, results in a disadvantage, as it undermines freedom in terms of achievement. Second, it pays no heed to achievement reasonably giving more importance to those who are incapable of reflecting on any one of those mental metrics. Besides, Sen argues that equality of opportunity does not accord with the equality of freedom, and its reason is rooted in the scope of the incongruity of human beings and the diversified meanings of efficiency. Developing a general methodological approach to revisit the notion of inequality concerned by exploring a particular substantive stand that Sen aims to underscore involves examining how social arrangements work to define freedom, capabilities, and welfare to ensure comparisons and assessments of quality of life.

## Revitalizing Moral Sentiment in Economics

In an explicitly metaphysical arena, the traditional "dichotomy" between the fact and value cannot ruminate on a *definite* splitting up along the lines of that affirmed by the logical positivists and their verificationist stance, which preserves the idea of value-free language and economy. A relativist account denies the cognitive prospect of the truth-value of an ethical statement. Later, Hilary Putnam singles out a reason (the collapse of the fact/value dichotomy) that will deeply disturb economists who crave the dichotomy and dismiss value-oriented economics. This reason is "an increased appreciation of what might be called the *entanglement* of fact and value" (Putnam and Walsh 2012, Putnam 1993, 145).

In 1998, the Nobel committee, in its felicitation of Sen's laudable contribution refers to his emphasis on: "an ethical dimension to economics and related disciplines." His precursors in twentieth-century economics had talked about value-free scientific economics. Their concern leads to a general skepticism about ethical values and relies on ascertainable facts. Sen reinstalls ethics into

economics. A trend could exhibit value-free language by prioritizing the moral concepts as descriptive parts of ordinary language. It is more psychological and literature-oriented than science for articulating descriptive moral concepts. The notion of descriptivism in ethical concepts (Putnam 1993, 145–146) closely parallels Sen's idea of “descriptive richness” (Sen 1992, 118).

As Nussbaum clarifies, Sen's account of the capability approach is a normative theory that preserves in alliance with justice, gender issues, and poverty to “identify capability as the most pertinent space of comparison for purposes of quality-of-life assessment, thus changing the direction of the development debate” (Nussbaum 2011, 19).

### On the Capability Approach: An Approach Toward the Value-Laden Economics

Sen originally introduced what he has recently described as “a particular approach to well-being and advantage in terms of a person's ability to do valuable acts or reach valuable states of being” (Sen 1993, 30) in his celebrated Tanner Lecture in 1979. This was influenced by Smith's analysis of “necessities.” Earlier, Sen endorsed the “*basic* capability equality” by segregating the utility principle of Utilitarianism and its dark corner of “utilitarian rule of distribution compounds” through giving more importance or salary to a strong worker rather than a physically challenged person (Sen 1973, 17). Despite emphasizing individual evaluative welfare in a particular sense, Sen bridges the capability approach as a universal theoretical basis for inequality and poverty in a general sense.

An approval of hierarchies of needs from basic needs to higher needs should sketch out an enhanced perspective consistent with Adam Smith's observation. Sen induces literature that secures interpersonal comparabilities (of varying degrees) from not just of utility sense but ponders on the growth of a wide variety of kinds of social choices. Of significance here is that an agent's choice is privileged by the balance of reasons to

render an alternative choice. Thinking of the question, we pivot on belief-desire psychology in terms of reason and rational choice. Still, it sounds inevitable to reflect on moral motivation and norms, which are a source of reasons for actions/functions. The capability approach underlines the delimitation of the informative traditional model of economics, which emasculated the normative approach of capabilities by privileging the calculus method of interest or utility theory.

The missing part of the traditional approach that Sen picks up is the notion of real freedom, viz capabilities that people take in through their being an individual and their continuous potential action. In a Kantian sense, Sen pivots around the intuitive determination of the wish/will that achieves freedom by applying thinking back to action or doing from a substantial opportunity. The capability approach revitalizes the focus from means (what people have) to ends (what they can do to access the recourses), considering that two people who have similar sets of resources may not accomplish similar ends due to their different abilities and circumstances. A healthy person and a physically disabled person working for an office could not achieve an equal outcome. But both deserve equal treatment and opportunities that hoist up equality of justice in work. The thread of the tapestry is interwoven with the multifaceted nature, flexibility, and potentials for well-being.

According to Sen's definition, “a person's ‘capability’ refers to the alternative combinations of functionings that are feasible for her to achieve. Capability is thus a kind of freedom: the substantive freedom to achieve alternative functioning combinations (or, less formally put, the freedom to achieve various lifestyles)” (Sen 2001, 75). The capability approach says that the success of a program does not rely on the utility process of increasing monetary welfare. Here it is necessary to have a sensitive moral and economic understanding of poverty, famine, and economic deprivation in the various catastrophic situations where our congregate “information base” sounds inadequate and restricted because the process fails to gather information about the resultant entailed from the given gross level of income or

production under different conditions. Making it explicit, Sen urges the concern of the age, social structure, gender, physical ability, and the country's social condition (disaster, flood, proneness to violence, insecurity, etc.) as factors related to the capability of the person to render monetary income into the ability to function in other spheres. In a nutshell, the capability approach looms to include all the concerning factors (in many senses) that seem of homogenous magnitude to welfare evaluation. Putnam writes: "Capabilities", in Sen's sense, are not simply valuable functionings; they are *freedoms* to enjoy valuable functionings, a point that is announced in the title of Sen's most recent book, *Development as Freedom*, and stressed throughout that book" (Putnam and Walsh 2012, 117).

### **Captivating Welfare Economics: Existential Humanism and Agency**

Welfare economics props up social and individual welfare incumbent with individual and collective utilities based on the person's preference satisfaction and aggregator functions. Now the point is that the social welfare functions turn toward a utilitarian social welfare function in retrospect, emphasizing the notion of maximizing the unweighted totality of the individual welfare and exclusive use of utility. Here individual utility becomes the exclusive criterion for welfare judgments.

One may ask the following questions:

- (a) Why does one have to pay attention to welfare economics?
- (b) What methodologies make the capability approach closer to welfare economics in a theoretical sense?

The structure of welfare economics in Sen's approaches – individual rights and liberties or measured poverty and inequality come from a moral point of view. The first approach pivots welfare, while the second caters to the capability approach.

The capability approach in welfare economics relies on four different methodological aspects:

- The choice for proper functions
- Measuring these functions at the individual phase
- The aggregation of this functioning into a scalar estimation of individual welfare
- Putting the aggregation of individual welfare forward to social welfare

It is pleasant to find an agreement wherein one could measure welfare in the functioning stage, albeit the welfare space measured in the functioning stage can differ from the welfare space measured in income/expenditure level. The more focused reason for this measurement illustrates that if we pursue the analogy moved over capabilities instead of functioning, the whole measuring progression becomes obscured. The crux of Sen's economics never appreciates any disinterested behaviors in economics and so intends to de-emphasize altruism and egoism as a tranquil meaning of economics outlooks. In his reassessment of the moral foundation of development economics, especially in his well-known paper "Ethical Issues in Income Distribution: National and International" (Sen 1981), Sen is explicit on the magnitude plea of utilitarianism and its normative influence on development economics, but it does not assure an expedient way to put forward the tripartite structure of utilitarianism – consequentialism, welfarism, and the calculus method.

Sen upholds the existential-humanistic approach that calls for thinking beyond oneself by prevailing over solipsism to take in true humanity. But he never preserves a doable aspect of a universalized consequentialist moral pattern, where the total facets of the inhabitants of the world need to be congregated together to entail an outcome (chosen morality). Sen insists on blatant forms of inequality and exploitation for a universalized consequentialism or utilitarianism that demines the notion of capabilities, which serve as an object of moral values. Things themselves do not hold any values. We are the subjects who impose values on them. Sen believes that "If

we value capabilities, then that is what we do value, and the possession of goods with the corresponding characteristics is instrumentally and contingently valued only to the extent that it helps in the achievement of the thing that we do value, viz. capabilities” (Sen 1997, 317).

### Person, Well-Being, and Self-Interest

Sen does not consider a quest for an evaluation of well-being as a counterpart of an element of justice, as John Rawls nurtured, but stipulates it to the loom of moral understanding. Sen defies the welfare economics that prioritized the utilitarian’s calculus method by excluding the nonutility movement in the sphere of moral judgments. Although Sen has often accredited his debt to John Rawls’ “Theory of Justice,” he also criticizes Rawls’ use of primary goods, for interpersonal comparisons because primary goods are mere means, not intrinsically worthwhile ends, and as a consequence, would not be able to account for the full range of the diversity of human beings (Sen 1992, 81–87).

Besides, the concept of person/agent has a dualistic philosophical sense in Sen’s early literature:

- (a) Person in terms of agency holds values, responsibility, and commitments.
- (b) Person in terms of well-being.

But in the later work (Sen 1992, 2001), he collapses this dichotomy by gearing up a person’s agency pertaining to well-being.

To talk about the agency and well-being, Sen frames a twofold criterion that pivots first a person’s agency achievement and then enhancement of well-being which are not entirely dependent hence they are circuitously related to each other. Second, despite their diverse importance, agency achievement and well-being achievement are causally allied. To articulate his thought, Sen considers well-being to be a matter of valuation, while utility, happiness, desires, etc., are values for the person’s well-being. But it is inevitable that being

happy does not stand for valuational activities. So, it follows that utility or happiness does not effectively denote well-being in general. This periphery examines the prospect of well-being from a different sense where the achievement in connection to objectivity and moral values goes beyond the expedition of a person’s well-being to commence distributive justice and evaluate the personal advantage of a person. This journey cheekily spins a normative stance where freedom is an instrumentally valuable achievement to a person and a refined characterizing function applied to the well-being and agency aspects conjointly.

Sen’s notion of “agency freedom” affirms a motivation toward self-regarding and other-regarding utilizing an overtly *normative* description that looks for human agency tied on threefold cords – reason to value, comprehending our lives, and exercising jointly in groups and institutions. Conceptualizing the agency achievement in the light of freedom and capabilities, we could judge through our values and objects in preference to external factors. Sen frameworks this motivation of agency as *reasoned agency* (Dreze and Sen 2002, 19). Devoid of a satisfactory altitude of well-being, freedom, and achievement, persons are incapable of realizing their potential agency. Parenthetically, they should weigh up their health, nutrition, well-being, education, job, and security more prominently to have the ability to decide on and the freedom to achieve what they ache for. In his classic *On Ethics and Economics* (Sen 1987), Sen worked on the interpersonal comparisons of utility. Sen emphasizes self-seeking behavior that hooks up an aplomb understanding of social arrangement and Pareto optimality. But the problem is that “The idea *that* overall social optimality must *infer alga* require Pareto optimality is based on the notion that if a change is advantageous for each, then it must be a good change for the society. That notion must in some sense be correct, but to identify advantage with utility is far from obvious” (Sen 1987, 38).

Now let us discuss “self-interest,” another crucial issue of Sen’s philosophy. Self-interest can be demonstrated in two disjoint subsets:

- (a) Truly self-interested actions
- (b) Pursuit of present aims

Smith clearly outlines his sheer derision for gross self-indulgences. Smith's prudence stands for the amalgam of two qualities:

- (a) Self-command (Stoics)
- (b) Reason and understanding

Sen articulates that even though prudence as a virtue works well resulting from "self-love," it needs to go beyond the concept of self-interest. In contrast to prudence, humanity and justice are more pertinent qualities that work for all (Sen 1987, 23).

Besides, for Sen, the notion of an agent's well-being hinges on their current functionings that have included the *activity* of choice and on the agent's required opportunities (freedom) to function compared to the incurred current functionings. Sen puts forward these needed opportunities or freedom for functioning in place of "capabilities." An agency freedom is a moral responsibility that the person upholds to achieve whatever they choose to achieve, and it is nothing but a power to act and be effective. Sen brings a normative outlook inter-reliant on functionings and capabilities. Sen emphasizes the agent-oriented capability approach that indispensably invigorates descriptivism on the agency to decipher a moral stance.

## Some Words

To emphasize choice without uncertainty, an agent must choose from a set of reciprocally exclusive outcomes. But one could face the problem that sometimes the mutually exclusive outcomes of an action hinge on other people's performance and their activities related to the set. Sen basically gives precedence to choice with certainty instead of choice under deliberate uncertainty (Sen 1993a; Morris 2010). Sen's economic theory neither collides with rational choice theory nor is impregnated by preference-oriented certainty principle. The vital point is that an

agent's choice behavior gains adherent in supporting choice functions. The rational choice-based theory might have a universal set of alternatives that seems context-sensitive. Sen is hesitant to accept a theory of rational choice exclusively derived from the agent's choices and reliability conditions devoid of underscoring the agent's choices concerning their preferences or motivations. Sen rebuffs any internal consistency of choice as a testable empirical hypothesis because of the internal inconsistency that delimits the scope of an agent's preference. For him, a fasting person and a person starving because of poverty have the same functioning, but a difference emerges because of their capabilities and choices. Although there is a choice for the fasting person not to continue her fast, this choice is not available for the starving person. The capability approach holds moral values and normative laws as spheres of choice and freedom.

What kinds of freedoms are capabilities? A very satisfying answer is available in Sen's literature (Sen 1992, 2001) when he says that capabilities are freedoms that conjure up real opportunities, which bring up the *presence* of valuable freedoms or its alternatives, in connection to opportunities despite its formal or legal essence, but more morally, conceptually and effectively (pragmatically) accessible to the agent. Nussbaum enshrines a list of capability approaches (in actual, an open-ended ten capabilities – *Life, Bodily health, Bodily integrity, Senses, Imagination, and Thought, Emotions, Practical Reason, Affiliation, Other Species, Play, and Control over One's Environment*) that could be applied for every country's constitution regardless of their caste, race, and livelihood. Nussbaum thinks her universal human development approach of "central human capabilities" is a fundamental moral entailment of a *quality life* worthy of human dignity for every human being on the earth to attain their "minimum core social entitlements," justice, and human rights (Nussbaum 2011). Sen distinctively refuses to secure "one predetermined canonical list of capabilities, chosen by theorists without general social discussion or public reasoning" (Sen 2005, 158). Development prevails by undermining unfreedom that

confines humans' choice and opportunity within a minimal boundary. This parsimonious point gives an advantage over the moral behaviors of the others in cultural variation to promote a set of choiceable opportunities for the people.

## Servant Leadership and Internal Social Capital

Jorge Linuesa-Langreo, Pablo Ruiz-Palomino and Ricardo Martínez-Cañas

Internal social networks; Organizational social capital; Servant management

## Introduction

In today's fast-changing business environment, having highly skilled individuals is an essential element in improving a firm's competitiveness. However, hiring the most talented people is not enough. Organizations need to develop structures and processes that enable employees to collaborate, cooperate, learn, and share resources. Therefore, research and business practice have focused on analyzing the effects of internal social capital, defined as the social relationships established within the organization that are based on information sharing, trust, and collective goal orientation (Leana and Pil 2006). Specifically, internal social capital is comparable to other forms of capital produced within the organization that brings multiple benefits (e.g., lower transaction costs, greater capacity for knowledge transfer) which improve business performance. Due to the importance of social capital for organizations, several studies have sought to understand the mechanisms that generate this valuable resource. In this regard, recent research has shown developing leadership that provides continuous support to employees

can improve internal social capital. Thus, managers that engage in servant leadership, and so display sincere and honest concern for the personal and professional growth of their followers, are likely to foster strong, quality social relationships within the organization. Hence, servant leadership may be an appropriate strategy for enhancing internal social capital.

## The Nature of Servant Leadership

Servant leadership has its origins in the essays of Greenleaf (1977), in which he develops the fundamental thesis: “The servant-leader is servant first [...] It begins with the natural feeling that one wants to serve, to serve first” (Greenleaf 1977: 27). Thus, servant leaders prioritize the needs of their followers before their own interests, helping them develop personally and professionally so that they can reach their maximum potential within the organization. Therefore, servant leadership, through its servant dimension, is highly moral and focuses on aspects of human nature itself.

Despite providing the basic premises of servant leadership, Greenleaf (1977) fails to establish a formal definition. For this reason, one of the first research lines aimed to establish a satisfactory conceptualization. The study by Eva et al. (2019) is significant in this regard, in that it carries out a systematic review of servant leadership, through which it provides an academic and rigorous definition: “Servant leadership is an other-oriented approach to leadership, manifested through one-on-one prioritizing of follower individual needs and interests, and outward reorienting of their concern for self towards concern for others within the organization and the larger community” (Eva et al. 2019: 114). Drawing on this definition, three fundamental characteristics that summarize the essence of servant leadership can be highlighted. First, servant leaders, as the name itself suggests, put the focus on the “other” (i.e., the follower). This distinguishes servant leadership from other styles (e.g., transformational leadership, authentic leadership) that focus primarily on the leader’s own

characteristics. Second, unlike other leadership styles oriented toward the fulfillment of organizational objectives, the servant leader’s primary motivation is to ensure at all times that the needs of each follower are met. These are not arbitrary desires, but genuine needs linked to followers’ professional and human development. Finally, the third characteristic is related to the sense of community, which shows that the service orientation of the servant leader has a broad meaning, being directed not only toward the follower, but also toward the organization and other agents, including the community and society in general.

A second line of research, parallel to the studies focused on conceptualizing servant leadership, has focused on analyzing the positive effects of this leadership style on employees and the organization, advancing the servant leadership theory (Eva et al. 2019). In this sense, several studies have shown that an organization headed by servant leaders creates a collaborative climate in the organization, fostering high-quality, supportive social relationships that can have an impact on greater individual and organizational effectiveness.

## What Is Social Capital?

Social capital has been addressed in different fields of study (e.g., education, economics, and demography). However, its origin lies in the field of sociology, where this phenomenon has been analyzed from the perspective of network theory and communities. In this sense, the works by Bourdieu (1986) and Coleman (1988) were key in promoting the concept of social capital. On the one hand, Bourdieu (1986) analyzes the benefits of sociability and explains how the construction of social networks, through collaborative strategies, allows agents to obtain mutual benefit in the long term. On the other hand, Coleman (1988) studies and defines social capital as a social network structure where individuals meet at the nodes, proposing that the degree of social interaction that occurs within the structure explains the differences in intellectual capital present among the various agents.

The studies conducted by Bourdieu (1986) and Coleman (1988) undoubtedly form the basis of modern social capital theory. However, those by Burt (1992) and Putnam (1993) brought a mature, global, and business-related vision to this concept. Thus, on the one hand, Burt's study (1992) is grounded in the thesis that agents compete in imperfect markets, where there is no homogeneous and strongly cohesive network. Through this idea, Burt (1992) develops the concept of structural holes, according to which an agent will possess greater social capital if they manage to better interpret the map of social relations and gain privileged access to areas where there is novel information and resources. On the other hand, Putnam (1993) demonstrated that organizations with quality social relationships based on trust obtain better results. These works were the basis for the study by Nahapiet and Ghoshal (1998), which provides one of the most widely used definitions of social capital in the field of business organization: "Social capital is the sum of the actual and potential resources embedded within, available through, and derived from the network of relationships possessed by an individual or social unit [...] It comprises both the network and the assets that may be mobilized through that network" (Nahapiet and Ghoshal 1998: 243).

## Perspectives of Social Capital

The social relationships that generate social capital can be developed inside or outside the organization, giving rise to the concepts of internal social capital and external social capital (Leana and Pil 2006).

From an external perspective, social capital is generated by the relationships the firm maintains with other agents or institutions. Under this approach, external social capital is defined as the set of resources a firm can access thanks to the establishment of inter-organizational relationships in a given network (Leana and Pil 2006). This perspective is useful for analyzing inter-organizational relationships and examining how the network provides access to valuable resources.

In this way, social capital emerges as a strategic resource that can explain differences in performance, even between companies in the same sector.

Internal social capital, meanwhile, refers to the social relationships (i.e., formal and informal) that are established within an organization. Through these relationships, resources are exchanged and information transferred, favoring the generation of new knowledge and the achievement of collective goals. Therefore, internal social capital is seen as a collection of resources that are available to the organization and that help achieve collective objectives.

## Dimensions of Internal Social Capital

The literature considers internal social capital as a complex and multidimensional construct (Leana and Pil 2006). In order to understand the concept, we must know the structure of the social network, the quality of the relationships established within it, and the resources available to the agents. In this sense, one of the most widely used classifications is that designed by Nahapiet and Ghoshal (1998), who propose that social capital is composed of three dimensions: structural, relational, and cognitive.

The structural dimension of internal social capital reflects the degree to which the members of the organization are interconnected. Thus, it comprises the network configuration through which employees share information and access valuable resources.

The relational dimension of internal social capital describes the nature and quality of the personal relationships that are established between members of the organization. Thus, two elements are essential for its formation: the trust established in relationships, and the social norms internalized by its members that define the patterns of behavior expected within the organization.

Finally, the cognitive dimension represents the common language used by employees in their interactions, with shared goals and identification with the organization being the key elements that allow employees to develop a common understanding and thus achieve collective goals.

## Servant Leadership and Internal Social Capital

Social exchange theory (Blau 1964) and social identity theory (Ashforth and Mael 1989) help explain the relationship between servant leadership and internal social capital in its three dimensions: structural, relational, and cognitive.

First, social exchange theory (Blau 1964) emphasizes reciprocity as a rule for the functioning of social relationships. Thus, when one person acts in favor of another, a feeling of gratitude is generated in the beneficiary which leads to tacit obligations to act in the same way. This feeling coincides with that expressed by followers toward servant leaders. Thus, servant leaders express genuine concern for the development of each of their followers, spending time and resources to foster interpersonal relationships that enable open and honest communication within the organization (cf., Eva et al. 2019). All these positive aspects toward the follower engender a feeling of gratitude and the need to reciprocate to the servant leader and the organization. In this way, it is possible to increase, on the one hand, the number of relationships within the organization and, on the other hand, the exchange of information, experiences, and resources that are available to all members of the organization. All of these are fundamental elements for the development of the structural dimension of internal social capital (cf., Leana and Pil 2006).

Second, regarding the relational dimension of internal social capital, servant leaders do not use coercive power in their interactions with followers, but a relationship of social exchange (cf., Eva et al. 2019). That is, these are relationships not based on economic exchange or contractual obligation, but on trust and reciprocity. Thus, drawing on the social exchange theory (Blau 1964), servant leaders, through their service dimension, achieve greater trust toward the leader and the organization among employees, which favors the cohesion and construction of strong and lasting social relationships within the organization.

Finally, the rationale for the relationship between servant leadership and the cognitive

dimension of internal social capital is supported by the social identity theory (Ashforth and Mael 1989), which argues that various organizational factors lead employees to put aside their personal interests, identify with the organization, and develop behaviors and relationships aimed at achieving collective goals. One of these essential factors is the presence within the organization of strong, proactive leadership, oriented toward the well-being of the organization's members. Therefore, the exercise of servant leadership can be responsible for generating in the employees this feeling of identification with the organization and making them feel the collective goals are also theirs. In fact, the servant leader, by providing care to followers, is considered highly attractive by the follower, helping them to give meaning to their work and to feel identified with the organization and its goals (cf., Eva et al. 2019). In addition, a servant leader, by promoting a shared vision among followers and a climate where employees can openly share their experiences and knowledge with their peers, favors the development of a common language and a sense of community within the organization (cf., Leana and Pil 2006).

## Conclusion

Servant leadership and internal social capital converge when emphasizing the importance of managers showing a genuine concern for meeting the needs of employees and thus achieving their full potential. In this way, first, servant leaders are seen as authentic ethical role models for all members of the organization who, through their social interactions, serve as an environmental stimulus to form frequent connections among them. Second, the presence of a servant leader within the organization ensures that, through their service dimension, the employees feel that they are treated as an end rather than a means, allowing for lasting and quality social relationships. Finally, positive affective feelings toward servant leaders activate the processes of identification with the organization and the way these leaders act. In

this way, employees are able to embrace the collective goals, commit to them, and develop a greater understanding of the organization's functioning. All these leads employees to mobilize their skills, abilities, and knowledge and put them at the disposal of the organization. Therefore, the presence of a servant leader enables followers to improve their social relationships, share information, deposit and access knowledge and experience in an easy and agile way, minimize transaction costs, improve coordination and knowledge, and ultimately achieve better organizational performance.

## Background and Definition of Service Leadership

Throughout the past few decades, a transformation has been seen in advanced economies, whereby these economies are shifting from an industrial to post-industrial model. This means that service sectors are playing an increasingly important role in the global market while manufacturing industries are gradually shrinking in relative size. This is especially true in Hong Kong, where service economies accounted for 92.2% of the gross domestic product (GDP) in 2016 (The World Bank 2018). While manufacturing economies are characterized by mass-produced goods through standardized procedures, proficient task-related skills, and by using top-down leadership styles with highly-centralized decision making, the main outputs in service economies are personalized services that involve substantial interactions between service providers and recipients. Service economies favor a service mindset and “bottom-up” leadership style with distributed leadership and empowerment (Shek et al. 2018). Since interpersonal interactions play a key role in service delivery, “doing the right thing” by adopting “correct” values is more important than merely “doing the things right”

by following the proper procedures. Indeed, a leader's morality has been historically emphasized in Chinese communities, given the morals-oriented nature of Confucian values and collective Chinese culture.

The development of service economies calls for leaders who have humanistic orientation, ethics, and willingness as well as capability to satisfy a wide range of needs of different stakeholders. However, existing leadership models only partially address the leadership qualities most appropriate for service economies. For example, the transformational leadership model points to ethical concerns of leadership but rarely discusses as service leader's competence and service mindset (Shek et al. 2018). Hence, there is an urgent need for a holistic leadership model that can guide leadership education and practice in the service era. In order to address such need in Hong Kong, Po Chung, the co-founder of DHL International and Chairman Emeritus of DHL Express (Hong Kong) and Chairman of the Hong Kong Institute of Service Leadership & Management (HKI-SLAM), proposed the concept of "service leadership" and the Service Leadership Theory. Chung defined service leadership as a service "satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one's self, others, groups, communities, systems, and environments" (Shek et al. 2015a).

The Service Leadership Theory has been used to guide leadership education at the eight universities funded by the Hong Kong Government, with the aim of nurturing students toward greater effectiveness as service leaders (Shek and Chung 2015). We have further examined this Service Leadership Theory by investigating the "dark side" of service leadership and developing assessment tools measuring service leadership attributes (Shek et al. *in press*, 2017a; Shek and Lin 2017). In the following sections, we will outline propositions from Service Leadership Theory, the dark side of service leadership, education of service leadership in Hong Kong universities, and the development of service leadership assessment tools.

## Propositions from Service Leadership Theory

Service Leadership Theory shares some commonalities with some existing leadership models, such as ethical concerns and the concept of satisfying followers' needs in the transformational leadership model (Shek et al. 2018). Nevertheless, Service Leadership Theory has its distinct features, including the service mindset, a new paradigm for defining leadership, key determinants of effective service leadership, and the consideration of contextual values, particularly from Confucianism (Shek et al. 2015a).

First, Service Leadership Theory strongly emphasizes service orientation. Unlike traditional leadership models where a leader-follower relationship is hierarchical in nature and a leader holds high status and power to maximize personal interests, Service Leadership Theory regards leadership itself as a service that satisfies a wide scope of needs. These needs include the needs of the self, others, groups, communities, Societies, and environments (Shek and Lin 2015a). According to this, a good service leader collaborates with others, values others' and one's own well-being, and transcends self-interest to serve others. In other words, a good service leader is expected to have a service heart and willingness to provide high-quality service to others.

Second, Service Leadership Theory differs from other models that call for leading others as the main focus. Service Leadership Theory asserts that leadership manifests in three realms, including self, others, and systems. This reflects the multilevel and systemic approach to leadership (Shek and Lin 2015a). In fact, self-leadership in terms of managing and improving oneself in various areas is strongly emphasized. The underlying belief is that a person is unable to lead others well or contribute to society's well-being unless he or she can lead him or herself productively. This philosophy incorporates the Chinese Confucian thoughts holding that one should engage in constant self-evaluation and self-reflection in order to regulate oneself well and improve continuously. This subsequently results in interpersonal harmony and social stability, as *The Great Learning*

(“Daxue,” 大學) maintains that “only after cultivating yourself, can you manage your household; only after managing your household, can you govern the country; only after governing the country can you bring harmony to the world” (“shen xiu er hou jia qi, jia qi er hou guo zhi, guo zhi er hou tian xia ping,” 身修而後家齊, 家齊而後國治, 國治而後天下平).

Third, while the traditional belief portrays a leader as a superior, talented, and great individual, Service Leadership Theory claims that everyone can be and is a leader at any given moment (Shek and Lin 2015a). Primarily, this notion recognizes each individual’s potential to lead with his or her own strengths. With this in mind, a service leader is humble and open-minded, able to identify his or her followers’ potential and nurture them to become service leaders as well. In other words, good service leaders serve as mentors to their followers (Shek and Lin 2015c). Second, this notion appreciates distributive leadership in service economy in terms of encouraging everyone to optimize his or her competence for assuming a leading role. To achieve this goal, one should take the initiative to continuously improve and fully utilize one’s personal service leadership qualities. Thus, good self-leadership is the prerequisite to actualize the theoretical notion that everyone can be a leader.

Fourth, Service Leadership Theory asserts that effective service leadership is dependent on three fundamental components: competence, character, and care (i.e., the 3Cs) (Shek and Lin 2015a). Competence refers to both intrapersonal skills (e.g., resilience and emotional intelligence) and interpersonal skills (e.g., the ability to resolve conflicts and build positive relationships) that make a leader competent in fulfilling his or her duties and inspiring teammates to do the same. As for character, a service leader should demonstrate character strengths that are valued across cultures and philosophies. Strengths of character, such as integrity and trustworthiness, let a service leader “do the right thing” and lead in a moral way. The third C is care, as one should be sensitive and willing to meet others’ needs. A caring leader will not satisfy his or her own needs at the expense of others’ benefits. More than that, a caring leader

will sacrifice his or her interests for the benefits of others. By equally emphasizing these three essential leadership qualities, Service Leadership Theory addresses leadership ethics (“being”) in addition to leadership skills (“doing”), and establishes a holistic model to explain how to better oneself and others and ultimately build a harmonious and functional society in the service era (Chung and Elfassy 2016).

## The Dark Side of Service Leadership

As aforementioned, the “3Cs” are globally valued and indispensable for effective service leadership. Consequently, a weakness or lack of any of these attributes can give rise to the dark side of a service leader, which is considered a “virus” by Chung and Bell (2015). A software virus can infect a computer simply through an infected email or download, to then attack and corrupt the computer’s operation system by making numerous copies of itself. Likewise, a virus in leadership can start small but reinforces and replicates itself through repeated negative behaviors. This ultimately brings a corruption of a service leader’s “Personal Operating System” (POS), which then influences how a leader collects and processes information, uses resources, and takes action (Chung and Bell 2015). By this mechanism, even a minor service leadership virus can create personal failures and organizational ineffectiveness. Empirical findings support this idea by showing the negative impacts of the dark side of leadership in multiple areas, including the leader’s own life, followers’ working attitude, mental health, job performance, and organizational outcomes, such as climate, turnover rate, and commitment (Shek et al. [in press](#)).

Some scholars conceptualize the dark side of leadership as ineffective and destructive leadership, with the former associated with incompetence and the latter related to unethical and uncaring attributes (Shek et al. [in press](#)). This echoes Chung’s argument that a lack of any aspect of the 3Cs constitutes the dark side of service leadership. Chung further claims that viruses in leadership are “anti-virtues” (Chung and Bell

2015). In other words, viruses in service leadership are characterized by negative attributes that represent the opposites of virtues that reflect positive traits and high morality. With specific reference to Chinese tradition, viruses are antitheses of traditional Confucian virtues (Chung and Bell 2015; Shek et al. *in press*), such as kindness (“ren,” 仁), righteousness (“yi,” 義), respectfulness (“li,” 禮), wisdom (“zhi,” 智), and trustworthiness (“xin,” 信). The corresponding viruses would be unkindness, unrighteousness, disrespectfulness, being unwise and untrustworthy, respectively.

To achieve effective service leadership, being free of viruses is critical. This is particularly important in Chinese societies where Chinese people have the high tolerance toward and unwillingness to report unethical behaviors of leaders (Zhuang et al. 2005). To some extent, this makes leadership viruses more harmful in the Chinese context. Chung has recommended several ways to prevent and reduce viruses in service leadership, such as cultivating virtues by providing service leadership education and creating a positive environment, restoring moral strength through reflection, taking action to remove viruses, and repairing interpersonal relationships (Shek et al. *in press*). Among these, the key principle is that we should not do viral things like cheating and lying if we do not wish to have these things done to ourselves. As Confucius advocated, “do not do unto others what you do not want others to do unto you” (“ji suo bu yu, wu shi yu ren,” 己所不欲, 勿施於人, *The Analects* 15:23),

## Service Leadership Education in Hong Kong

Traditional leadership education highlights the importance of professional and leadership skills in the field. Such approach applies well in manufacturing economies, where operations require hands-on skills. However, in the contemporary service era, production-related skills are no longer the only qualities that make one an effective leader. Thus, leadership education in services societies like Hong Kong should include broader

concepts in response to the demanding call for effective service leaders. To this end, with the financial support provided by the Victor and William Fung Foundation, and the collaborative effort from HKI-SLAM, a multiyear project entitled “Fung Service Leadership Initiative” (FSI) was initiated at Hong Kong’s eight public universities since 2012. The initiative is a strategic attempt to strengthen service leadership education based on the Service Leadership Theory. The goal is to sustain Hong Kong’s competitiveness and keep its position as a leading service economy.

Since the start of the initiative, the universities have designed and implemented their own service leadership curriculum and programs to enrich university students’ knowledge of service leadership, help them cultivate their 3Cs, develop their service spirits, and improve leadership practice in their daily lives (Shek and Chung 2015). For example, The Hong Kong Polytechnic University (PolyU) developed credit-bearing subjects as well as noncredit-bearing training programs and carried out evaluation studies adopting different strategies. These have included subjective outcome evaluation, objective outcome evaluation, and qualitative evaluation (Shek and Lin 2015b).

With regard to the credit-bearing course, a subject entitled “Service Leadership” is embedded in the General Education curriculum and offered to students at PolyU. This classroom-based course helps students learn leadership models regarding the service sector; realize the importance of the 3Cs in determining effective service leadership; reflect on their own strengths and weaknesses regarding service leadership characteristics; develop and apply essential service leadership qualities; and understand the significance of effective service leadership to the well-being of oneself, others, and the society (Shek et al. 2015c). To date, approximately 1,000 students have enrolled in this subject. As reflected by the positive response, to evaluation studies, students were highly satisfied with their learning experience and the subject is effective in cultivating students’ service orientation and helping them improve core service leadership attributes (Shek et al. 2014, 2015b; Shek and Li 2015b). Additionally, a service-learning subject

entitled “Service Leadership through Serving Children and Families with Special Needs” is offered to undergraduates with the aim at helping them apply service leadership knowledge and skills through serving children with special psychosocial needs. These children include those with social and economic deprivation, behavioral and emotional problems, or developmental disorders (Shek et al. 2015c). This course is also helpful in enhancing service leadership qualities in university students (Ma et al. *in press-a*, *in press-b*; Leung et al. 2016). These subjects were awarded the Bronze Awards in the QS Reimagine Education Awards 2016.

Besides, a modified version of the above-mentioned “Service Leadership” subject was designed as an academic component of several leadership training programs, including “Silk Road Youth Leadership Programme,” “Global Youth Leadership Programme,” and “SOAR Youth Leadership Programme,” which were collaboratively organized by PolyU and higher institutions in China mainland, such as Xi’an Jiaotong University and Peking University. The modified service leadership course is offered to university students taking these leadership programs in an intensive mode (i.e., 3.5–4.5 days) with the purpose of promoting their understanding of service leadership concepts and enhancing their service leadership attributes. Evaluation findings also demonstrated that students were very satisfied with the innovative service leadership education programs (Shek et al. 2017d; Shek and Li 2015a). In addition, participants showed significant improvement after the completion of the intensive course in fundamental service leadership attributes, such as self-leadership, care, and character strengths (Shek et al. 2017c; Shek and Lin 2016).

## Assessment Tools

In Hong Kong, evaluation work has been done to assess the effectiveness of service leadership education. However, tools used in existing studies to measure service leadership qualities have not been

customized for the Service Leadership Theory (Shek et al. 2017c; Shek and Lin 2016). Effective measurement of service leadership qualities is not only vital to the legitimacy and future development of concepts and theories of service leadership, but also fundamental to scientific research. For example, it is important to investigate determinants and outcomes of service leadership qualities and evaluate the effectiveness of service leadership training programs (Slavec and Drnovsek 2012). We argue that the lack of validated assessment tools to measure service leadership qualities (i.e., knowledge, attitude, and behavior) has hindered education and research in service leadership in Hong Kong and other regions.

In view of this research gap, the research team at PolyU launched a research project entitled “development and validation of measures based on the service leadership model,” and designed as well as validated three related assessment tools. These included service leadership knowledge, attitude, and behavior scales with the involvement of seven other Government-funded universities in Hong Kong. To elaborate, the knowledge scale measures what one knows about service leadership in an objective way using multiple-choice questions. The original long-form knowledge scale for service leadership (i.e., SLK-LF-200) consists of 200 questions covering key points from the Service Leadership Theory, such as the core belief that “everybody can be a leader” and the three components of an effective service leader (i.e., the 3Cs). After initial content validation and criterion-related validation, a short-form knowledge scale containing 50 items (i.e., SLK-SF-50) was obtained (Shek et al. 2017b; Shek and Lin 2017). The attitude scale addresses one’s perceptions of service leadership as to what extent one agrees with the basic ideas of the Service Leadership Theory. A long-form attitude scale including 132 items (i.e., SLA-LF-132) was first designed and a short-form of 73 items (i.e., SLA-SF-73) was constructed after initial content validity test (Shek et al. 2017a). The behavior scale assesses whether one’s leadership practices

demonstrate leadership skills cherished in a service economy. The original long-form behavior scale (i.e., SLB-LF-97) had 97 items, among which 65 were retained in the short-form scale (i.e., SLB-SF-65) after initial validation studies.

To further validate the three assessment tools, a large-scale validation study was collaboratively carried out by the eight public universities in Hong Kong involving 4,486 undergraduates. Specifically, the three mentioned short-form scales (i.e., SLK-SF-50, SLA-SF-73, and SLB-SF-65) were administered via online surveys to those students recruited from the universities. For knowledge, attitude, and behavior scales, 40, 46, and 38 items were retained, respectively, in the finalized short-form scales (i.e., SLK-SF-40, SLA-SF-46 and SLB-SF-38). These finalized scales indicated good psychometric properties and can be regarded as valid, reliable, and robust measurement tools in assessing service leadership qualities. Related findings of the large-scale validation study are reported in a special issue.

## Shareholder Theory

Dawn A. Shearrow

College of Business, University of Rhode Island, Kingston, RI, USA

## Synonyms

Business ethics; Ethical reciprocity; Moral conflict; Stakeholder theory

## Introduction

Business ethics is an island unto its own yet called upon by all disciplines, scholars, corporations, and executives to anchor in their harbor for moral support. Upon arriving to any seaport, ethical dilemmas, conversations of moral judgment, and threats of corruption dominate the scene. Despite the fact that scholars acknowledge the nexus of normative ethics as a “north star” to guide through calm and treacherous waters alike, the question surrounding the disposition of ethics as it relates to Shareholder Theory still remains.

Wading deeper into the murky waters of controversy encompassing such a noteworthy theory and integral contribution of the firm, the conversation and view of Milton Friedman's (1963) that “social responsibility of business is to increase profits” continues to be challenged. Shareholder theory dictates that managers of the firm prioritize the interests of the shareholders which equates to increasing their wealth by means of profit. As such being the mindset of the firm, all other

stakeholders are pushed to the wayside viewed as pawns only to further the purpose of profit. Being socially responsible includes addressing the ethical implications and consequences of elevating shareholders interests as the utmost importance. CEO’s, scholars, and boards are beginning to recognize the value that all stakeholders have and understand that the firm in the twenty-first century looks much different (D’Cruz et al. 2022).

Moving in a New Direction

Roundtable conversations continue to move towards accepting the new reality of what social responsibility means for the firm (Fitzgerald 2019). The CEO of Blackwell, Larry Fink, took action by addressing CEOs in an open letter to reconsider the purpose of the firm (George 2018). Ignoring the contributions of all stakeholders of the firm somehow seems irresponsible, unethical, and non-inclusive. A direction society has moved away from. Fink’s letter may have been the catalyst for CEOs of nearly 200 companies to acknowledge through a joint statement that “all stakeholders are essential.” Unlike other statements proposed by roundtable discussions, specific authorship was given by 183 CEO’s declaring (by attaching their signature) their commitment to all stakeholders (Harrison et al. 2020). Table 1 provides the details of the most important elements of the declaration.

Upon review of the CEO’s commitment objectives, it supports the scholarly perspectives that the firm in the twenty-first century is much different than defined over four decades ago (Alvarez et al. 2020). Alvarez and authors articulate the many moving parts of the business environment that dissuade the perspective that the firm exists solely for economic purposes and argue that all stakeholders bring value to the bottom line. The future of business ethics is also of great importance focusing on technology, megatrends, and work (D’Cruz et al. 2022). Big Business, the power of AI, and the role religion plays in the workplace highlight a few areas that clearly uncover the nuances influencing the re-imagining of the purpose of the firm. The

**Shareholder Theory, Table 1** Adapted from Roundtable Commitment (Harrison et al. 2020, p. 3)

| While each of our individual companies serves its own purpose, we share a fundamental commitment to <i>all</i> of our stakeholders. We commit to: |                                                                                                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Commitment                                                                                                                                        | Description                                                                                                                                                                                                                                                    |
| Delivering value to our customers                                                                                                                 | We will further the tradition of American companies leading in the way in meeting or exceeding customer expectations.                                                                                                                                          |
| Investing in our employees                                                                                                                        | This starts with compensating them fairly and providing important benefits. It also includes supporting them through training and education that help develop new skills for a rapidly changing world. We foster diversity and inclusion, dignity and respect. |
| Dealing fairly and ethically with our suppliers                                                                                                   | We are dedicated to serving as good partners to the other companies, large and small, that help us meet our missions.                                                                                                                                          |

terrain is clearly different from four decades ago and must be considered.

The Debate and Moral Conflict

The ongoing debate has conflicted scholars for decades. Moore (1999) proposed the idea of the tinged shareholder theory introducing the shared perspective of stakeholder and shareholder theory ensuring equity of both. Schafer (2008) argues that the stakeholder model of the firm is a more ethical approach inline with the idea of social

responsibility. He addresses that individual morality plays a part in managerial decision-making. The idea that humanity is left at the door and the best interest of all stakeholders is top of mind knowing allegiance is to the shareholder is quite the conflict. From a moral theories perspective of Kantianism, utilitarianism, virtue ethics, and Judeo-Christian ethics, being socially responsible favors stakeholder theory (Schafer 2008). Mansell (2013) research also addresses the idea of moral obligation to the stakeholder drawing on the moral philosophy of Immanuel Kant “duties of right” and “duties of virtue.” History confirms that ethics and moral obligation contribute to scandalous outcomes if ignored.

When corporate corruption is discussed or ethical indiscretions are referenced, it does not take long for Enron to surface in the conversation. It has become an iconic indiscretion that influenced change within the context of the firm’s ethical behavior. The adage that “Rome was not built in a day” so is the reality that corruption does not happen overnight. Ethical indiscretions start small and begin to fester throughout an organization. Ultimately unethical behavior becomes an acceptable practice that it is embedded within the culture of the organization. The collapse of Enron was a combination of unethical choses starting at the top e.g., misleading shareholders, moving assets around to show cashflow, creating a “rank and yank” system that created a climate for employees to lie and do anything to keep their job, along with many accounting indiscretions (Parboteeah and Cullen 2019). So how can corporations avoid scandalous outcomes? Is the idea of making profit above all else to satisfy the shareholders wealth create pressures to behave outside the margins of ethical practice?

### **Ethical Reciprocity as a New Perspective of the Firm**

Arriving 1 day in a world where no ethical conflict exists reflects a utopian society. Despite this reality ever coming to fruition, the task of ethical scholars and corporations must continue the

journey of uncovering efforts towards ethical and moral resolve of the firm. Salter (2019) shares many of the sentiments above particularly as it relates to shareholder theory. Answering the question of corporate corruption and indiscretions is not new to Salter. His prior work has focused on crony capitalism (2014), how short-termism creates corruption (2012), and invention corrupted (2008) insights from Enron. His working paper, *Rehabilitating Corporate Purpose*, uncovers the idea that shareholder value maximization has separated the public causing mistrust in capitalism as a system of economic governance. His insights surround the idea of capitalism and justice embedded with Aristotle’s theory of reciprocal justice, ultimately landing on the idea of ethical reciprocity as a focus of the firm.

The idea of ethical reciprocity suggests that there is an equal exchange or agreement between the firm and all stakeholders (shareholders included) to receive something of value in return for given contribution. A logical premise to propose if seeking a “new” meaning of the firm being “socially responsible.” This equitable exchange discourages any one stakeholder to dominate the firm’s attention (Salter 2019). This could be a potential resolve as it appears to align with the CEO Roundtable commitments (see Table 1 above). Building on Schafer (2008), Judeo-Christian ethics leans into this premise when discussing the “body of Christ” and its parts. The scripture in I Corinthians 12:12–27 (NCV) addresses the significance of each part of the body e.g., the arm, the hand, and the head, contribute to the whole of the “body” and its ability to function properly. The loss of any one part hinders the body’s ability to function as needed. The ability to achieve certain tasks is hindered or can no longer perform certain activities.

This parable is reflected throughout society and a fundamental philosophy. Consider team sports as one an example and the firm as another. Each are dependent on the defined foundational structure (team members and employees) to carry out their role to achieve success (winning and profit). Logic from this perspective would convince anyone that one entity, such as shareholders,

being elevated over the other would eventually cause conflict. Conflict not only with outcomes, but amongst “all” of the moving parts.

## Conclusion

Turning a “big” ship around is no easy task. Moving towards a new theory of the firm has been researched by scholars and discussed by corporate executives for decades. Now, discussion has finally moved towards action. Actions not only seen by the commitments of certain CEOs, but corporations taking action through their strategic planning efforts, changing their approach to the meaning of being socially responsible, and agreeing that “all” stakeholders contribute to the value of the firm. Ignoring the reality that being “socially responsible” in the twenty-first century for the firm looks different is a potential ethical hazard. The great historian, Arnold Toynbee, in his studies identified that societies have the capacity of their own destruction despite their success or sophistication (Toynbee 1934), “Great civilizations die from suicide, not by murder” (Salter 2019 p. 6).

It is no mystery that shareholders provide the needed capital for any firm to exist as intended. Yet without the other stakeholders’ contributions the firm would not exist. The idea of stakeholder value advancing in the ranks and CEOs encouraging its equitable value to the firm reflects societal changes in how business is now conducted. This positioning provides an opportunity for the firm to move further away from its own destruction.

Pushing for change and approaching the future of business with eyes wide open is imperative for the success of the firm. Friedman’s argument that being socially responsible is solely focused on profit would be detrimental to the firm and ultimately contribute to an unhealthy culture. Focusing on ethical reciprocity as the moral principle needed to move towards a more equitable and appropriate foundation for the twenty-first century firm is a notable approach to consider.

## Shell Companies

Alex C. Michalos

University of Northern British Columbia, Ottawa, ON, Canada

### Synonyms

Corporate vehicles; Dummy companies; Front companies; Holding companies; Hollow companies; Letterbox companies; Mailbox companies; Special purpose vehicles

### Definition/Introduction

A shell company is a legally incorporated entity that may consist of nothing more than a postal address of a registering agency and a contact person at that address.

### Description

Examples fitting our definition could be found in the 200,000 or more companies registered at 1209 North Orange Street in Wilmington, Delaware (Obermayer and Obermaier 2016). Findley et al. (2013) offered a crude definition of a shell company taken from the website of a firm in Wyoming that marketed and housed over 2000 shell companies. “A corporation is a legal person created by state statute that can be used as a fall guy, a servant, a good friend or a decoy... A person you can control... yet cannot be held accountable for its actions. Imagine the possibilities!” Obermayer and Obermaier (2016) quoted a former US tax investigator who said that “shell

companies are to a wide range of wily criminals what getaway vehicles are to bank robbers – they allow criminals to escape.”

Van der Does de Willebose et al. (2011) offered a somewhat more detailed definition based on what is not in such a company, namely, “...a shell company can be defined as a non-operational company – that is, a legal entity that has no independent operations, significant assets, ongoing business activities, or employees” (p. 34). When compared to the features of an ordinary, standard, or normal company, the term “shell” appears to hit the nail right on the head. Ordinary companies usually occupy some functional space (e.g., buildings with appropriate fixtures, furniture, machines, washrooms, dining halls, recreation centers) in which employees and/or machines perform some sort of economic activity (e.g., producing and marketing some goods and/or services, purchasing and consuming intermediate goods and/or services); employees may have unions or not, engage in intra- and/or intermural activities (e.g., singing groups, sports teams, community services, chambers of commerce, newsletters); personnel at diverse levels working on strategic plans, with formal and informal meetings with or without minutes and a hierarchy of offices (e.g., committee chairs, recording secretaries, foremen and women, consultants), producing financial and nonfinancial reports, interacting with financial service providers (e.g., banks, lawyers, management and accounting professionals). (For a thorough and provocative investigation of a central service provider and its enablers, see Obermayer and Obermaier (2016).)

The literature on the unethical and/or illegal functions of shell companies is certainly much larger than the literature on the ethical and/or legal functions. There are, however, a number of legitimate functions of shell companies. For examples, shell companies (1) might be created to provide a corporate vehicle for company mergers; (2) to provide a vehicle for a joint venture without a formal merger; (3) to provide a neutral jurisdiction to locate the home for a joint venture ensuring fair legal treatment of companies initiating the venture from different jurisdictions; (5) to create distinct entities transferring and

holding different assets or debts; (6) to function as a holding company; and (7) to meet the requirements and enjoy the benefits of non-resident investors in foreign jurisdictions (e.g., in free trade zones); (8) to represent the residual assets and/or liabilities of a company being phased out (Van der Does de Willebois et al. 2011).

Regarding the unethical and/or illegal functions of shell companies, in the broadest of terms, shell companies are used to hide or shelter some activities and/or assets (e.g., real estate, art works, jewelry, cash, gold, investments, stocks or bonds, relationships, taking bribes) connected somehow to some beneficial owner(s) from the view of legal authorities, e.g., tax collectors, creditors, potential biological or otherwise legal heirs, persons entitled to court-ordered compensation for misdeeds, marital or parental obligations. The term “beneficial owner(s)” is used to denote “the natural person(s) who ultimately owns or controls a customer and/or the person on whose behalf a transaction is being conducted. It also incorporates those persons who exercise ultimate effective control over a legal person or arrangement” (Van der Does de Willebois et al. 2011).

It is important to maintain the disjunction “unethical and/or illegal” because, unfortunately, legal procedures can be and routinely are exploited in ways that are certainly unethical and may or may not be illegal, depending on which jurisdictions are involved and how the laws in various jurisdictions are interpreted. Most notoriously, this can occur when shell companies are used to launder money, evade taxes, rob the public purse or facilitate exchanges among drug dealers, arms dealers, human traffickers, and terrorists. Van der Does de Willebois et al. (2011) noted that approximately two million companies are incorporated every year in the United States and “in virtually all cases, . . . without obtaining the names of the people who will control or benefit from those companies. . . . [This] is especially troubling given the huge number of legal entities formed in the United States each year – around 10 times more than in all 41 tax haven jurisdictions combined. Because so little information is collected on U.S. companies, it is impossible to tell how many are shell companies and not

operational companies, but U.S. law enforcement consistently has indicated that the number is high enough to cause grave concern.”

For the 150 cases of “grand corruption” (involving “illicit assets” totalling \$50 billion), that van der Does de Willebois et al. (2011) examined, they reported that “Companies were used to hide the proceeds of corruption in 128 [85% and] . . . In more than half of the cases analyzed that involved any sort of company, that company was a shell company.” In broad strokes, they concluded:

- “In cases where the ownership information was available, most cases of large-scale corruption involve the use of one or more corporate vehicles [companies, trusts, foundations and fictitious entities] to conceal beneficial ownership.
- The precise patterns of misuse vary from country to country, although the corporate vehicle most commonly used globally is the company.
- Shelf companies [relatively long lasting shells] pose a particular problem, as they provide criminally inclined individuals with a company history and set of company officials, all entirely unrelated to the corrupt individual.
- Most companies used to conceal beneficial ownership are non-operational [shells], although operational companies are also used, particularly for paying bribes.
- The use of professional nominees and front men increases the lack of transparency of corporate vehicle structures.
- Bearer shares [bearing no owners’ names], although still used to conceal beneficial ownership, are being used less frequently than they were in the past.
- A tiered structure of corporate vehicles owning or controlling others can be particularly effective in hiding beneficial ownership. . .
- To be able to identify suspicious, economically unsound structures, law enforcement needs to understand the rationale behind legitimate structures. At the moment, law enforcement’s understanding of corporate law is limited.”

Findley et al. (2013) undertook “the first international relations (IR) field experiment on a global scale” with a survey of 1,264 service provider firms in 182 countries. They found “In the overall sample, 26.2% of the service providers contacted and 48.9% of those who actually responded were willing to defy international standards in providing a shell company without

requiring certified proof of the customer's identity." About these percentages, they sadly remarked that "The relatively high rate at which service providers are willing to offer anonymous, untraceable shell companies is a sobering comment on the difficulties faced in combating money laundering, corruption, the financing of terrorism, and other related crimes."

To address the problem of shell companies being used to hide the ultimate owners and/or controllers of illicit activities, every source consulted for this essay strongly recommended that every country should create a national registry of companies that would, among other things, be available at least to law enforcement officers through an automatic exchange of information and include names of the beneficial owners, e.g., see Shaxson (2011), Zucman (2015), Obermayer and Obermaier (2016), Martini and Murphy (2018), Meunier (2018), and Comeau (2019). Van der Does de Willebois et al. (2011) provided the most detailed list of information required for such registries. Of their 14 recommendations, they included:

- (1) "Certain basic information on legal entities should be maintained in corporate registries... [e.g., entity name... date of incorporation... entity type... entity status... address of the principal office... particulars of formal positions of control]".
- (7) "Jurisdictions should ensure that all service providers to corporate vehicles – whether in establishing them, administering them, or providing financial services to them – collect beneficial ownership information when establishing business relationships" ... (8) Documented particulars of a legal entity's organization, including those details that indicate beneficial ownership and control, should be held physically or electronically within the jurisdiction under whose laws it has been created" ... (11) "Jurisdictions should ensure that financial institutions gather beneficial ownership information and develop and maintain complete beneficial ownership compliance files".

The public pressure for the creation of publicly accessible registries of the sort recommended in the previous paragraph is increasing. Deneault (2015) claimed that "Canada and the U.S. are the two most lax jurisdictions in the world when it comes to the rules for preventing the incorporation of anonymous shell companies." Martini and

Murphy (2018) reported that "15 G20 countries had weak or average frameworks" regarding registration of companies' beneficial ownership, a number that had dropped to 11 by 2018. According to Meunier (2018), "By early 2020, all 28 European Union members and a majority of FATF's [Financial Action Task Force] 37 members will be on track to implement publicly accessible registries of beneficial ownership... [and] More than 40 countries now have, or are committed to having, public registries." Because the UK's extensive array of overseas territories is by far greater than any other country, it is very encouraging to hear that "On May 1, 2018, the UK Parliament voted to require the UK's 14 overseas territories to publish public registers of company ownership by the end of 2010" (Meunier 2018). These territories include the notorious tax havens of Bermuda, the British Virgin Islands, the Cayman Islands, Gibraltar, Montserrat, and the Turks and Caicos Islands.

## Social and Economic Mobility

Pamela Buckle  
Robert B. Willumstad School of Business,  
Adelphi University, Garden City, NY, USA

### Synonyms

Class inequities; Socioeconomic status

### Introduction

Status hierarchies exist in human societies. People who comprise a society can be grouped based on the economic resources available to them, and a person's location in a particular group dictates the status they are accorded in that society. Various exclusionary mechanisms keep a society's economic and social status groupings intact (Banerjee and Mehta 2017); such mechanisms operate to keep people in the status groups where they are born. Nevertheless, our interest here is social and economic *mobility*. "Mobility" indicates the capacity for motion. While a society's economic and status groupings tend to remain fixed, the term *social and economic mobility* describes the phenomenon whereby individuals do not necessarily remain located within one particular group for their entire lifetimes. A person's socioeconomic standing can decrease;

so too can it increase. People tend to have considerable interests and exert considerable energies maintaining the economic and status resources they possess and finding ways to access more.

## Social and Economic Mobility

Upward mobility involves *adapting* oneself to the practices of the status group one covets. Certain human behaviors can be viewed as performative—as ways of enacting the desire to belong to a higher status group. Where one lives, the language one speaks, clothing one wears, and food one eats are examples of behavior associated with people's current and desired socioeconomic standing in societies the world over. For example, one's address, the number of storeys in one's home and the number of families living in it, the building materials used for its construction (e.g., bamboo or bricks), and whether home is rented or owned are among the observable indicators of one's current socioeconomic standing (Patel 2017). The language one speaks (and teaches one's children to speak) is also a performative behavior: styles of linguistic communication can be proud declarations of one's cultural belonging; they can also be viewed as parochial and "lesser than" the language of other, more economically affluent groups (Hicks 2017; Zaprudski 2007). The clothes people wear signal their economic means and strivings (O'Toole 2018), explaining why the brand labels on wealthy people's clothing are carefully watched and sought-after by people wanting to be seen as belonging to those wealthy classes. And the choice of foods to eat is also a performance; practices of "cultural omnivorism" demonstrate that people aspiring to higher socioeconomic classes will tend to conform to the eating practices of high-status reference groups (Domański and Karpiński 2018), hence connotations of caviar and champagne as indicators of status. Where people seek the esteem of people in higher classes, they will often disidentify with behaviors associated with the class of their birth, repressing experiences and memories associated with their pasts in favor of behaviors they

associate with increased social standing (Cahill 2018; O'Toole 2018).

One significant behavior illustrating the attempt to adapt to higher social and economic standing is the choice one makes about geographic location. Willingness to move can mean the opportunity to increase one's fortunes in comparison with those who remain stationary. Numerous examples throughout human history reflect this (Hatton and Williamson 1998). Moving away from the place where one is born is a way that people respond to being relegated to marginal positions in society (Ursin 2018); marginality and mobility are related concepts. When individuals' options to achieve increased financial resources or social esteem are limited, they may move to other parts of their home country (i.e., migrate), as seen in the movement of people from rural areas to cities for thousands of years. Similarly, people may leave their home country altogether (i.e., immigrate) in search of greater fortune. In either case, moving can enable an individual to attain greater access to property, income, education, and occupational status than those who remain in place (Alexander et al. 2017; Pérez 2017). Spatial mobility is no assurance of increased socioeconomic status (Fortunati and Taipale 2017); however, it is a behavior evidencing the human desire to compensate for limitations in one's financial and social resources or simply the hunger for more.

People from individualistic cultures tend to associate social and economic mobility with conscious choice: the assumed logic is that the talents people have plus the choices they make during their lifetime will dictate the social and economic status they achieve. Such emphasis on competence and agency obscures the influence of contextual factors on social and economic mobility. It is not always the case that the skills one develops and knowledge one acquires are transferable to more lucrative industries (Cassel et al. 2018); mobility varies by sector in an economy, and labor market conditions change over time. Furthermore, the initial conditions of one's life exert influence on a person's social and economic mobility and that of their children as well. The income level of one's family of origin has

intergenerational impact, according to longitudinal research. In the United Kingdom and the United States, in particular, income mobility is low – that is, people tend not to exceed the incomes achieved by their parents (Gregg et al. 2017). This empirical reality contrasts starkly with the mythology of “the American dream” – the assumption that the United States is a meritocratic society, wherein people willing to work hard will be rewarded financially and accomplish social standing exceeding that which their parents achieved (Carroll and Hoffman 2017; Ellis 2017; Swan et al. 2017).

The difference between myth and reality in the United States draws attention to the role of perception in the phenomenon of social and economic mobility. Human societies are held together by intersubjectively shared understandings about what it means to be part of a collectivity and about differences among people within that collectivity (Thompson 1985). People imagine how life would be in classes different than theirs. They develop beliefs about the potential for mobility in the society where they live and what it would take to move into a higher class. Some imagine an expanded identity for themselves personally, as future members of higher classes to which they aspire (Vokes 2018). Such imaginings and beliefs may be true or inaccurate; regardless, they influence decisions people make and behaviors they exhibit. For example, high school and college students who believe that higher grades will enable them to get good jobs exert greater academic motivation and persistence than those who don't hold this belief (Browman et al. 2017), regardless whether job prospects for such students are, in fact, greater. People's assumptions about the social mobility and economic rewards available to people of different genders impact the careers they will choose and whether or not they actively pursue higher salaries – even when actual opportunities for people of their gender differ from what they assume (Boyer et al. 2017). When citizens of a country believe that greater opportunities are available than those they currently possess, political discontent and protest are more likely (Healy et al. 2017), regardless whether that perception is accurate. Perceptions

about what is *true* exert strong impact on the phenomenon of socioeconomic mobility, so too do perceptions about what is *right*. Ethical complexities associated with social and economic mobility are many. Goals of greater social status can be held as ethical imperatives and thus help to account for the drive with which some people pursue higher stature in life. For example, when people raised in a disadvantaged area ascribe moral meanings to their future aspirations, those meanings can fuel powerful motivation to pursue goals, even in the absence of obvious advantage and presence of formidable obstacles (Baker 2017). Ethical considerations can also help us to understand why some people have not exploited economic opportunities throughout history. When, for example, “the city” has been viewed as a place of moral decay, impoverished people living in rural areas risk being condemned as sinful if they attempt to move into a commercial center to seek greater fortune (Greenfield-Liebst 2017). That dreams of greater status can be perceived as both ethically justified and morally bankrupt highlights something important. Where social and economic mobility are concerned, *facts* have impact, but the *narratives* people develop to make sense of themselves, their surroundings, and their potential futures are equally as potent in explaining the actions people take to change their standing.

Where the narrative “I can have more in life” becomes strong, an array of interesting facts comes into play. Formal schooling can be an effective path, given the strong correlation between education and increased economic and social mobility (Hacker and Hayes 2017). Indeed, some universities actively advertise their programs as mobilizing people for participation in higher socioeconomic classes (Beutell 2013; Leonhardt 2017). “I am escaping to a more promising future” is oftentimes grueling, evidenced by the levels of stress and other adverse mental health outcomes that can emerge by people striving to move into a higher social or economic class (Brietzke and Perreira 2017). At the personal level, narratives about increasing social and economic status can alter people’s lives in significant ways. It also alters the structure of a society,

changing the size of the various social classes, the dispersion of the population, and the distribution of its wealth throughout a nation’s geography (Du 2018).

Given the stakes, not only for an individual but for an entire society, it is unsurprising that governments through history have sought to control social and economic mobility.

Colonialism has been one practice whereby strategies are developed to limit the social and economic status accessible to indigenous peoples, relative to their foreign rulers (Schauer 2017). Today, calls for educating citizenry the world over are made by those who view it imperative for creating the conditions for wider public participation in governance (Natale et al. 2013). The United Kingdom created a Social Mobility Commission in a 2010 act of Parliament, seeking to monitor that nation’s progress toward increased mobility for its population. The German federal government has set liberal policies regarding economic immigration, though not without national debate (Mayer 2017). The costs and benefits of permitting people to move across borders in pursuit of greater economic and social opportunity are hotly contested among member nations of the European Union, and elsewhere, inspiring criticisms that efforts for territorial control impede people’s “right to mobility and a just share of the Earth’s resources” (Nevins 2017).

The structures of human societies tend to change slowly. The notion of social and economic mobility speaks to the phenomenon whereby individuals or groups change their financial standing and status more quickly, outpacing gradual forces of societal evolution. Social structures are amalgams of tradition that support human life; they can also act as the strongest forces for disparity and subordination (Barker and Feiner 2004) and the greatest barrier for improvements in the quality of life available to people (Natale et al. 2013). People in every society perceive possibilities other than the social and economic circumstances in which they presently live. Those perceptions, how available opportunities are avoided or exploited, and how adaptively certain behaviors are performed influence the ways in which people’s socioeconomic status moves during their lifetimes.

## Social Construction

Scott Grills  
Brandon University, Brandon, MB, Canada

## Synonyms

Constructionism; Phenomenological Sociology; Social Process Theory

## Definition

Social construction refers to the processes that accompany the joint acts through which the social world is created. Social constructionism is one of the two main traditions within the sociology of knowledge (along with social determinism). Social constructionism attends to processes such as objectification, internalization, and reification as they relate to substantive areas such as social problems, gender, the medicalization of deviance, science, knowledge, and truth claims more generally. As Berger and Luckmann (1967: 1) assert, “reality is socially constructed and . . . the sociology of knowledge must analyze the processes in which this occurs.”

## Description

The social constructionist tradition is interested in everything that constitutes knowledge in any given society and the various subcultures therein. In this sense, social constructionism is a radical tradition, in that it does not give primacy to dominant ideologies, but rather attends closely and fully to the social processes that accompany the development, continuance, and potential rejection of various knowledge claims. Truth, therefore, is a quality attributed to an idea by some audience and is as fully a social construct as any other knowledge claim actors may make.

## Social Construction as Social Process

The social constructionist tradition focuses on how meaning is made. Sharing common ground with other interpretive traditions, people are understood to act toward the social world on the basis of the meaning it holds for them (Blumer 1969). While meanings arise through interactive processes, these processes themselves shape the qualities that are attributed to meanings and meaning sets. The social construction of knowledge, therefore, is an ongoing process whereby knowledge claims are advanced, challenged, objectified, internalized, and reflected upon. We may profitably distinguish between common sense

knowledge (shared understandings that facilitate everyday life), well-informed knowledge (a depth of understanding beyond everyday knowledge whereby ideas are accompanied by an analytical precision), and expert knowledge (those whose work makes a contribution to knowledge creation) (Schutz 1976). While all knowledge is social constructed, the norms for advancing knowledge claims vary considerably between everyday knowledge, well-informed knowledge, and expert knowledge. However, all are associated with the processes of objectification and reification.

## Objectification

The social world is comprised of culturally available typifications that are shaped by the here and now (Schutz 1976). The world into which the child, or the homecomer, or the stranger enters is made objectively available through the shared linguistically renderings of the world. While these constructs may have a taken-for-granted quality to them for everyday members, social constructionists draw out how everyday knowledge makes the world of social facts and thereby structure experience. As Berger and Luckmann (1967: 112–113) stress, “incipient legitimation is present as soon as a system of linguistic objectifications of human experience is transmitted. For example, the transmission of a kinship vocabulary *ipso facto* legitimates the kinship structure. The fundamental legitimating ‘explanations’ are, so to speak, built into the vocabulary. Thus a child learns that another child is a ‘cousin,’ a piece of information that immediately and inherently legitimates the conduct with regard to ‘cousins’ that is learned along with the designation.”

Therefore objectification is inextricably bound to language and other related sign indicators. We may use the indicator “dog” and convey to a child that the category of dogs is distinct from the category of “cat,” but at the very same time convey that the class of social objects understood as dogs may also be understood as companion animals, pets, service animals, farm animals, or food sources. That is, objectification needs to be understood in terms of the finite provinces of meaning

that sustain the objectification through both language and practice. If one alters the referential province of meaning the corresponding objectifications may also change.

## Reification

Reification is the social process through which human produced phenomenon are denied their humanness and viewed in nonhuman terms. That is, the products of human action are seen as being produced by some other non-human or super-human forces or entities. As Berger and Luckmann (1967: 106) note, examples here include facts of nature, cosmic laws and/or divine wills. Reification is a particular form of objectification, for the very social processes that create knowledge serve to erase, erode, or otherwise conceal the social processes by which knowledge is created.

Becker (2014) addresses a challenge in the study of the reification of ideas in his book *What About Mozart, What About Murder*. Therein he addresses a central critique of the constructionist position which I have framed elsewhere in this way: “It is all well and good to suggest meaning comes from some audience, but are there not acts that are so fundamentally offensive, abhorrent, and/or evil that they are inherently wrong? And if that is the case, one might make the leap in logic and assert that a central premise of (constructionist traditions) falls” (Grills 2016: 156). Becker’s answer to such challenges is instructive here.

The question of whether or not some aspect of the social world is considered deviant requires is an empirical one. It can only be answered by turning to the world of everyday life and attending to rule creation and the application of those rules to particular case at hand. However, the answer to the question “is an act evil?” does not rely upon empirical evidence, but rather is contingent on analysis from a defined set of moral principles. Therefore, the tasks of the philosopher and the sociologist are distinct ones. The study of reification is a decidedly empirical enterprise – one that is at odds with those who may have a variety of

interests in play to resist and silence such empirical work.

## Social Construction and the World of Facts

There is an cartoon where row upon row of filing cabinets drawers lament the state of the “fact” – they are labeled with names like “our facts,” “their facts,” “absolute facts,” “neutral facts,” “bare facts,” and so on (Frandon 1977). On Jan. 21, 2017, in a *Meet the Press* interview Kellyann Conway (Counsellor to the President of the United States) offered an additional modifier to the idea of the fact – the “alternate fact.” She said, “What you’re saying it’s a falsehood. And . . . our press secretary gave alternative facts to that.” This produced a media thunderstorm of critique – is not the world comprised of “facts” (i.e., that which is true) and the world of “nonfacts” (i.e., that which is empirically untrue). Was the crowd attending the inauguration of President Obama in Washington smaller than that for President Trump? In a world of alternative facts, the answer to this question became contested and contestable. At a first and somewhat naive glance, the world of empirical facts seems to resist and challenge the social constructionist position – after all it should be clear who won the election, if the temperature has increased, and which sports team won the series. But what we take as evidence to construct our collective facts is highly problematic. A small example illustrates the point here. Every Canadian of a certain age who was remotely interested in sport was enthralled by the Canada–USSR hockey series of 1972. What was advertised as a sure triumph of superior Canadian hockey skill over the less able “Russian” team turned out to be anything but. Yet in game 8, with a last moment goal that has become part of legend, Canada won the series five games to three. However, Pravda (the Soviet news agency) reported that the USSR had won the series on aggregate goals 32 to 31. Who won? To answer that question we need to attend to the social construction of various truth narratives.

The status of a measure as a fact has more to do with the meanings attributed to an idea (or measure or indicator) than it does the measure itself. Things we consider facts move in and out of relevance (e.g., gender was considered a salient fact in accessing the voting booth), and various segments of societies attempt to have their evidence taken as fact (e.g., efforts to establish the medical benefits of marijuana consumption). Blumer’s classic essay on the social construction of social problems is instructive here. He writes: “I want to stress that among the wide variety of social conditions or arrangements that are recognized as harmful by differing sets of people, there are relatively few that achieve legitimacy” (Blumer 1971: 302). That is, the social conditions necessary to make the recognition of the “fact” of the issue at hand has more to do with the social process of legitimizing, authenticating, and having one’s facts recognized as such than it does the “intrinsic gravity of the social problem” (Blumer 1971: 303).

## Summary

The social constructionist tradition contributes an important voice to the empirical study of ethics in the making. By attending to the social processes by which the worlds of truth, objectivity, reality, certainty, and uncertainty are created, the social constructionist tradition encourages an examination of the intersubjective provinces of meaning that we build with each other.

## Social Construction of Businesses

J. Angelo Corlett

Philosophy & Ethics, San Diego State University,  
San Diego, CA, USA

### Introduction

Businesses come into and go out of existence on a continual basis, and they are protected by laws and regulations which delimit their powers in order to protect other businesses, persons, and nonpersons in the event that said businesses might wrongfully harm others. In the United States, there is an entire field of law, business law, which is devoted to addressing matters of business. While this essay is not devoted to the field of what business law says about how businesses are constructed, it is about how businesses are socially constructed. That is, this is an essay about the metaphysics and ethics of businesses as socially constructed entities. It is, in other words, a contribution from the perspective of social ontology (the philosophical study of social being) and

what some leading social ontologists have to say about how businesses are constructed and some of the ethical implications thereof.

Specifically, this essay shall appeal to the insights of three leading social ontologies, those of Margaret Gilbert, Raimo Tuomela, and John Searle, respectively, in order to shed some important light on the socio-ontological construction of businesses. Along the way, I shall make some critical remarks about each social ontology, though none is intended to undermine what each such ontology can contribute in illuminating the social ontological structure of businesses.

### Margaret Gilbert's Joint Commitment Theory of Groups and the Social Construction of Businesses<sup>1</sup>

Gilbert states that certain rights and duties (obligations) accrue to those in jointly committed plural subjects such that if a member of the group fails to fulfill her duty in congruence with the joint commitment, then other group members are in positions to confront (“rebuke”) her about said violation of the group norm in that commitment to said group norm constitutes a joint commitment to it as a body (Gilbert 2014: 8). A joint commitment is “a commitment *by* two or more people *of* the same two or more people” (Gilbert 2014: 7). More fully: “In the basic case, it is necessary and sufficient to conclude this process that, roughly, each makes clear to each his personal readiness to contribute to it, in a way that is entirely out in the open to all. Each understands that once this has happened, the process will have been concluded” (Gilbert 2014: 7). This amounts to what Gilbert refers to as the “common knowledge” criterion of plural subjecthood (Gilbert 2014: 29). Examples of plural subjects include informal joint commitments to walk or engage in a project together, as well as more formal ones such as a marriage (Gilbert 2014: 259 f.). It is not, on her view, that every such relationship constitutes a joint

<sup>1</sup>This section of this entry is based on Corlett (Forthcoming).

commitment. Rather, it is that many such relationships do. Gilbert provides more detail regarding the nature and function of plural subjecthood throughout her decades of voluminous writings.

It is important to understand how Gilbert's analysis can explain certain aspects of how businesses come into being. Typically, a group of persons form a joint commitment to start a business according to the business laws of their community(ies). And, on Gilbert's analysis, they do so with the understanding that the others in the business, the official leadership at least, do so and in accordance with the rules and policies that govern said institution. Once those rules and policies are agreed on by members of the business in congruence with the business laws governing the federal, state, and local laws according to which said business seeks to function, the business exists – it comes into being as a social construction. Although this is a rather basic understanding of how a business comes to be on a Gilbertian social ontology, it is sufficient to see that those human individuals who form a joint commitment in such a context seem to straightaway qualify as morally and perhaps even legally responsible agents as plural subjects. Together they form a decision-making conglomerate which generally can be held accountable for wrongdoing for which it is responsible (acts with intent, voluntariness, knowledge, etc.). Those business officials forming the joint commitment form collective beliefs which serve as a basis of some or all of the businesses charter, stated goals, and ideals. Such beliefs also provide insight into the manner in which the business regularly functions from day to day. This much about Gilbert's notion of plural subjecthood and how it can be applied to business ethics is both helpful and reasonable. But difficulties arise with regard to Gilbert's notion of how such joint commitments can be rescinded and the implications this idea has for business ethics.

Specifically, what concerns me most about Gilbert's analysis is her insistence that there is a symmetry between the formation of a joint commitment, on the one hand, and its dissolution, on the other. That is, Gilbert insists that both the formation and the rescission of joint commitments require permission of each party to the

commitment. In Gilbert's oft repeated words, "Just as the readiness of each is required to bring the joint commitment into being so the concurrence of each is required in order to rescind the commitment. No party can rescind it unilaterally. Nor can any one party rescind any part of it unilaterally, since it does not have parts" (Gilbert 2014: 32; also see Gilbert 2000: 17, 21–22, 26–27, 29–31, 53, 57–59, 82; Gilbert 2006: 142–143; Gilbert 2014: 40, 65, 87–88, 90, 138, 193, 218).

### **A Problem with Gilbert's Plural Subject Theory**

While my primary concern is with the rescission of joint commitments between group members and how that may adversely affect members' personal autonomy and self-respect, thereby questioning the reasonableness of someone's entering into joint commitments in the first place, this concern poses problems for Gilbert's discussion of rights and perhaps even the role of associative duties within members of jointly committed plural subjects. This is a particular problem concerning the implications which Gilbert's analysis might have for the nature and function of businesses.

Gilbert's requirement that the rescission of joint commitments be made jointly between each group member undermines personal autonomy of said members, especially in joint commitment-based marriages which are plural subjects. As we shall see, this Argument from Personal Autonomy seems to count against Gilbert's analysis of plural subjects in a roughly similar manner in which it counts against Tuomela's analysis of we-mode groups. What adult person with adequate self-respect would enter into such a commitment, thereby waiving her autonomy? Does not self-respect require that marital partners reserve the right to unilaterally rescind their joint commitment in marriage for any number of reasons, i.e., without the permission or approval of their jointly committed partners? Does she not have a right to do so without the sort of rebuke discussed by Gilbert when one member seeks to rescind the

joint commitment without such joint approval? Does not each party to a joint commitment possess a right to unilateral rescission from the group, a right which correlates with a duty of other group members to not interfere with her exercise of said right? Gilbert argues that each group member of a joint commitment possesses rights against other members of the group such that there is a legitimate expectation that each group member can be held responsible for her failure to abide by the terms of the joint commitment. However, what exactly grounds such claims? Furthermore, are these claims of sufficient strength to outweigh the claims to personal autonomy that each member of the group possesses just in case a member desires to exit the group unilaterally? The problem here is not that each group member always makes a good decision to exit the group. In fact, her decision might be a morally flawed one. But she still possesses certain moral rights to personal autonomy to make even precisely such poor decisions. This is in part what the right to personal autonomy protects. So while a Gilbertian analysis of social commitment might plausibly entail that group members are within their rights to rebuke the exiting group member, said group member ought to be construed as possessing a moral right to exit the group without their permission anyway – even if the decision to exit is a poor one. The right to personal autonomy is much like the right to freedom of expression in that each protects not only morally justified decisions but poor ones also.

Applying this matter to businesses, Gilbert's analysis appears to have the problematic result that no business official can rescind her joint commitment to the business absent the approval of the other officials of said business. But this neither matches the reality of how businesses function nor provides a favorable account of the manner in which businesses ought to function in that it would deny business leaders the personal autonomy required for their self-determination, self-respect, self-worth, and related factors. So it is unclear the extent to which Gilbert's analysis of plural subjects can serve as a fully adequate account of how businesses either function or ought to function insofar as the preservation and

promotion of personal autonomy and self-respect are core values of any plausible theory of how groups such as businesses do and ought to function. The fact is that business officials in the United States at least can depart or resign from the role in a business at will, and they ought to be able to do so insofar as personal autonomy is a moral value which should continue to be accorded to business persons. In this manner, Gilbert's social ontology and in particular her conception of joint commitment, while quite useful in general, has limited use in business ethics insofar as it does not seem to be able to account for the value and role of personal autonomy in business. But perhaps there are other social ontologies which can avoid this difficulty.

### Raimo Tuomela's "we-Mode" Theory of Groups and the Social Construction of Businesses<sup>2</sup>

Tuomela (2013) addresses the ontology of certain organized groups such as corporations and states. Given that his analysis of social entities uses corporations as examples of paradigmatic social entities which can form and hold beliefs, make decisions, etc., his account is especially relevant to and useful for business ethics. His account concentrates on institutional groups in which decision-making and acting are based on the authorization of some members to carry out one or more of the group's tasks (Tuomela 2013: 160). Tuomela's approach is based on the idea that the acting agent in central group contexts is the group viewed as an intentional agent and whose members are engaged in "we-reasoning" from the group's point of view (Tuomela 2013: 15). Most of the conceptions apply to a paradigmatic "we-mode" group, which is democratic and autonomous (Tuomela 2013: 17). The we-mode is the act of "we-thinking" by group members (Tuomela 2013: 2) with its central function being the collective acceptance of the group ethos with collective

<sup>2</sup>This section of this entry is a slightly revised version of Corlett and Strobel (2016) and Corlett and Strobel (2017).

commitment and entailed mutual belief about collective acceptance (Tuomela 2013: 29). It is based on notions of group reason, collective commitment, and the collectivity condition (Tuomela 2013: 7).

A we-mode group exists if and only if (i) it has accepted a certain ethos as a group for itself and is committed to it (Tuomela 2013: 27); (ii) every member of the group normatively ought to accept the ethos as a group member, at least in part because the group has accepted the ethos (Tuomela 2013: 27); and (iii) it must be a mutual belief in said ethos that (i) and (ii) apply (Tuomela 2013: 27). A group agent is a collectively constructed functional social action system (Tuomela 2013: 51). In general, the behavior of the group agent is similar to the behavior of individual agent (Tuomela 2013: 22). The group agent conception omits qualitative sensations and emotions. But groups share similar intentional features with individual agents (Tuomela 2013: 23). Despite having a fictitious structure, a group agent can have an epistemically objective existence which gives the group agent system the power to act (Tuomela 2013: 51). Tuomela's we-mode account explicates the group's attitudes in terms of the members' reflexive performative collective construction of contents for the group, as we-mode beliefs and goals differ from I-mode beliefs and goals. It also creates more collective order, stability, and persistence than the I-mode in certain situations (Tuomela 2013: 16).

According to Tuomela, individualism is a doctrine which stresses the individual over the group and emphasizes individual autonomy and self-determination. Simply put, individuals are in charge of what they do (Tuomela 2013: 9). This view is compatible with existence of irreducible groups (Tuomela 2013: 8). However, methodological individualism is not. Methodological individualism "makes stronger claims, consisting of property-expressing predicates that refer to an individuals' psychological or physical properties of the kind that do not involve or presuppose irreducible groups or their properties" (Tuomela 2013: 9–10). It holds that the conceptual understanding of an individual's action is based on his or her own attitudes and reasons, which may

concern other agents' attitudes and reasons. This includes reducible group attitudes or reasons, or other nonsocial reasons. Its ontology consists only of the activities and properties and interactions between individuals, and it may contain groups and group properties that are reducible to the individualistic basis of (i) and (ii), above (Tuomela 2013: 10).

On Tuomela's view, an individual who performs a joint action should base her reasons for participatory action on the group, and the good of the group overrides members' individual, private reasons. The we-modal structure is top-down, which the group taking precedence over the individual group member. The I-modal structure, by contrast, is bottom-up, with the individual taking conceptual importance over the group (Tuomela 2013: 5).

An I-mode group is collective consisting of individual agents in an I-mode group if and only if (i) the members of said group privately accept some goals, beliefs, standards, etc. for the collective, forming the privately shared ethos, and accordingly are committed to the group's ethos at least because others privately accept the group's ethos and that they are so committed is mutually believed in the group and (ii) the members of said group believe that they themselves are group members and they need not believe of all of the other members that they are also members (Tuomela 2013: 33). Tuomela recognizes that there are other forms of I-mode groups (Tuomela 2013: 6). Members can perform tasks in either the we-mode or I-mode. However, Tuomela claims that the best functioning groups occur with a substantial number of we-moder in the base (Tuomela 2013: 26). A we-moder is a person who predominantly functions as a group member in the we-mode (Tuomela 2013: 24) and ideally can think and act only for group centeredness rather than from a sense of self-centeredness (Tuomela 2013: 38). This distinction is the basis of Tuomela's claim about the irreducibility of groups (Tuomela 2013: 91). This irreducibility is due to the members' interdependencies and interactions, as well as changing membership within the group. If the group is regarded as an intentional group agent, then members identify with its

goals, views, and norms. Members relinquish their independent reasons to act in favor of acting for the group's reason (Tuomela 2013: 22).

The notion of acting for reasons is generally regarded as a central notion in accounting for attitudes and activities of agents (Tuomela 2013: 98). In general, a person acts for a *we-mode* reason if she takes as a central reason for that action that which her group wants, intends, believes, etc. and in general is something that requires his or her participation (Tuomela 2013: 102). Social reasons stem from conformative or non-conformative attitudes and dispositions that human agents have as well as the need and desire to cooperate with intentional states of their peers (Tuomela 2013: 101).

The collectivity condition is satisfied simultaneously and interdependently for all members, rather than as individuals (Tuomela 2013: 8). The collectivity condition for the group states that, necessarily, based on group acceptance, a group's goal is satisfied for it if and only if said goal is satisfied for any group member *qua* group member. This condition ties together a group's goals and members' goals (Tuomela 2013: 41).

Furthermore, Tuomela states that groups can operate in a logical space of reason and justification because members can make intergroup promises and commitments and at least on some occasions can be held responsible for their own actions (Tuomela 2013: 25). There are three basic features of collective commitment. First, *we-mode* collective commitment is based on a group agent's commitment, either due to an internal or external leader or the members' collective acceptance. Next, *qua* being collectively committed, the members of a *we-mode* group are a group normatively committed to one another to perform their parts of the required collective activity since the group agent's intention cannot typically be satisfied by a single member. Finally, *qua* being based on the group's commitment, a member is accordingly committed to the group and to its members to further the group's interests and perform her part (Tuomela 2013: 44).

*We-mode* commitment to the group's ethos amounts to the commitment on the member level. The starting point is acceptance of the

ethos and commitment to satisfy and maintain it. Members must jointly bound themselves to the ethos. Collective commitment is required to effectively coordinate activities (Tuomela 2013: 45). On a member level, group members are disposed to create group reasons for their participation. There is a difference between a group agent's reasons and group reasons. A group agent's reasons are the reasons of the group itself, whereas group reasons are the reasons of the individual members for their participatory actions (Tuomela 2013: 39). Group reasons are desire-independent and help form normative expectations (Tuomela 2013: 40). The connection is the "*we-reasoning*" in which the members engage when they act as members, creating the group's point of view and using it to construct authoritative directives, entailing the change from the *I-mode* to the *we-mode*. Tuomela notes that members do not have to have the same motivation or reason that the group agent has (Tuomela 2013: 39).

Collective acceptance is arrived at via *we-reasoning* (Tuomela 2013: 125). If group members collectively agree on an attitude toward a content for the group, they have collectively accepted that attitude. This involves acceptance of a content in a certain attitudinal mode, requiring members to have sufficient reliance on the other members' functioning in an equally group-oriented manner (Tuomela 2013: 124). Members become obligated to promote the ethos and act accordingly within group contexts through acceptance of group membership and, most centrally, its ethos (Tuomela 2013: 26). It presupposes the members' understanding that they, by their acceptance, are making an agreement to go along with the resulting joint decision (Tuomela 2013: 137).

*We-mode* proposals entail a pre-commitment from members, an obligation to accept and promote the group's attitude, which is arrived at after the group's decision-making (Tuomela 2013: 125). A *we-mode* proposal that is accepted may be only some members' decision. However, all that is required is that the accepted proposal belongs to a well-informed and a sufficiently mature member's goal set (Tuomela 2013: 140).

After acceptance, an attitude is formed. A shared *we-attitude* is a possible social reason

for which the participants perform their parts of a collective social action (Tuomela 2013: 103). There are two types of we-attitude. The first is a plain we-attitude, which is similar to a we-want situation. An agent has the attitude and believes that others have that attitude as well as the belief that there is mutual belief among group members that that attitude should be held. The second is a reason-based we-attitude, in which the agent has the attitude in part because other agents in the group have the attitude and it is mutually believed that the members of the group have or ought to have that attitude (Tuomela 2013: 102).

We-thinking expresses collective intentionality, or what Tuomela refers to as “aboutness.” Intentions are used analytically as pro-attitudes, the content of which describes what the agent intends (Tuomela 2013: 64). The content of any pro-attitude can be characterized in terms of satisfaction (Tuomela 2013: 66). Further, a collective intention refers to beliefs or wants ascribed to a group or to a collective and to the group members collectively, as a group (Tuomela 2013: 63), and it includes collective intentional states and activities (Tuomela 2013: 6). Intentional states such as beliefs or wants can be either mind to world, world to mind, or mind to mind when dealing with relationships between the group and the external world, as well as interrelationships between its own intentional states (Tuomela 2013: 22). Group intention obtains when the group intends to perform a collective action (Tuomela 2013: 88).

We-intentions are intentions that one has in virtue of functioning as a group member. In we-mode intention, the intending subject must be we, not I (Tuomela 2013: 67). We-intention entails a participant’s intention to participate in their performing X together, either in an actional sense or in the sense of taking part in the group’s responsibility for X (Tuomela 2013: 73). In we-mode intention, the satisfaction of the intention is for the goal of the group. For we-mode, there must be joint intention. Members must participate in joint intention, either directly or indirectly (Tuomela 2013: 68), through contribution, not necessarily action (Tuomela 2013: 69). A joint

intention is ascribed to several individuals collectively. The participants of joint intention are assumed to act as group members and thus to comply with the group’s ethos (Tuomela 2013: 74).

We-mode joint intention presupposes that the participants understand that a joint action is involved (Tuomela 2013: 75). We-mode intention involves collective commitment, the collectivity condition, and group reasoning. The group reasoning condition is addressed by both acceptance of a particular belief as content and the acceptance of the goal of the acceptance of that belief. It requires committing oneself to the intention of the action, and the collectivity condition involves the joint intention to complete this goal for the group (Tuomela 2013: 69).

We-mode cooperation depends on full collective intentionality that involves joint goals and intentions, joint actions, and group reasons (Tuomela 2013: 147). Any group action must in general be based on or involve at least a sufficient amount of intragroup, intentional cooperation between members (Tuomela 2013: 152). As we-mode is intrinsically cooperative, agents need not reflect on their private goals and performances (Tuomela 2013: 156). We-mode group action requires cooperation between the members for satisfactory performance of its actions and is therefore intrinsically cooperative (Tuomela 2013: 148). Thinking and acting in the we-mode is to see one’s activities essentially as part of what the group is doing (Tuomela 2013: 153). To think and act in the we-mode is to think and act fully as a group member (Tuomela 2013: 37), which means that the member is not necessarily fully aware what is required of him or her (Tuomela 2013: 153).

Members give up or delegate part of their authority and autonomy to an authorized operative in the group and so are normatively bound to comply with the group’s directives (Tuomela 2013: 115). However, a leader’s power holds only so long as the members give it to her (Tuomela 2013: 161). Authorized operatives ought to act as the group requires, with accordance to preemptive, normative group reasons.

There is an assumed quasi-moral commitment to not disappoint other group members (Tuomela 2013: 116). As Tuomela puts it, a strong we-mode group exemplifies the slogan of the Three Musketeers: “One for all, and all for one!” (Tuomela 2013: 254). Moreover, he claims that the most efficient groups are autonomous (Tuomela 2013: 53). Group authorization can be internal, in which case the members give the authorization. Alternatively, authorization can be external wherein such authorization originates from an outgroup agent. Ideally, we-mode groups should be internally authorized (Tuomela 2013: 160).

According to Tuomela, hierarchal relations are sometimes a more efficient way to organize a group. Authority relations within a group in general center in part on the distinction between operatives and non-operatives (Tuomela 2013: 161). The task of authorized operative members is to create normatively and publicly binding decisions and to act for the group in light of the collective acceptance of members (Tuomela 2013: 164).

Another of Tuomela’s main claims is that groups that function on the basis of we-thinking are solidary groups (Tuomela 2013: 244). A we-mode group is solidary in the intragroup sense of its members being pro tanto required to cooperate with each other in group affairs when acting to promote the group’s ethos (Tuomela 2013: 16). Solidarity includes acting and thinking cooperatively, fairly, helpfully, etc. (Tuomela 2013: 242). There is solidarity on the member level, or within the community, and on the group level, or within structure of the group. It can also be internal or within the group or to another solidary group (Tuomela 2013: 242–243).

While Tuomela’s analysis represents an important breakthrough in social ontology, there are problem areas. First, a paradigmatic group (on his view, such as a corporation) is both democratic and autonomous. By “autonomous” he means “free from external domination” (Tuomela 2013: 17). In his discussion of collective commitment within we-mode groups, Tuomela claims that “a member cannot unilaterally rescind her commitment to the ethos without

the others’ permission.” “This is because,” he asserts, “she has given up part of her authority to act to the group and needs the others’ permission to get it back” (Tuomela 2013: 43). This is what he means when he writes that paradigmatically, group members “may also, perhaps upon satisfying some special conditions, in principle enter and exit such a group freely without internal or external coercion that compromises their free agency” (Tuomela 2013: 27, emphasis provided). By “special conditions,” Tuomela means that “autonomous” group members must have “others’ permission” in order to exit the group for reasons stated. He continues: “More concretely put, a member participating in collective commitment does not have the right to leave the joint project under way, because that might harm the other participants, as it might not be possible to complete the project as well, if at all, without the member in question, and because, in any case, the member has bound herself more strongly to the group than in the I-mode case” (Tuomela 2013: 27). The group ethos is paramount to we-mode groups, and such would be threatened if group members were permitted to decide on their own to depart such groups’ absent permission from other group members or if a group member dissented from the group ethos. But it is unclear how many or what percentage of group members must grant one the right to depart from the group. Must it be, for instance, a simple majority, a particular minority, or all members of the group who must grant such permission? And what precisely would serve as the plausible, non-arbitrary standard in the answer to these questions?

Furthermore, as Tuomela states, “if there indeed objectively are persons who accept the same E [ethos] and mutually correctly believe that E has been accepted but are completely mistaken about who the other members are, one may still say that they have created a group” (Tuomela 2013: 29). While Tuomela’s point is well taken, it might be plausibly argued that such a group lacks a level of solidarity that one might reasonably ascribe to a well-organized, decision-making group such as a strong we-mode group. Moreover,

it is even unclear that Tuomela's claim that "they have created a group" is plausible insofar as the group was "formed" accidentally instead of with the knowledge of group members of the group's membership which in turn makes group decision-making, planning, and action more solidary. How is it reasonable to ascribe to a strong we-mode group ontological status insofar as members of the group do not know or truly believe who the other group members are? While it is reasonable to do so in terms of vague groups such as anonymous donors to a particular cause or charity, it makes less sense to do so in terms of ascribing membership to corporate boards of directors or governments which Tuomela has identified as paradigmatic examples of we-mode groups. It seems more reasonable to say of the former groups that they have created a group than it does to say that the latter individuals have done so, assuming, of course, that intention to form a particular group is relevant to the establishment of groups. Otherwise, it might be difficult to distinguish between the actual formation of a group and the mere desire to do so or between the cooperative intentional formation of a particular group and the accidental formation of one. The implications of Tuomela's we-mode group analysis of groups such as corporations for businesses is important in that it is unclear, not unlike Gilbert's theory of joint commitment of groups, that personal autonomy and self-respect, two core moral values, can be accommodated by such a philosophical account.

### John Searle's Realist Theory of Groups and the Social Construction of Businesses<sup>3</sup>

In Searle (2010), Searle reiterates the importance of our ability to impose certain functions and statuses on brute reality which these objects do not possess in light of their intrinsic physical

structures (Searle 2010: 7). These functions only work by way of collective acceptance of the functions imposition on the object, and without this collective recognition, the status functions would be nonexistent (Searle 2010: 8). All of these status functions carry deontic powers which give us rights and obligations. Because of these deontic powers, humans can act in direct contrast to their desires and even certain instincts (Searle 2010: 9).

Furthermore, according to Searle, institutional facts, as we know them, are created by special speech acts known as declarations (Searle 2010: 12). Perhaps Searle's favorite example of socially constructed reality is that of money: Currency is created by people in society agreeing by way of speech acts on what counts as money for exchange purposes. With these speech acts come a direction of fit. Word-to-world direction of fit is that of a downward direction in which something is seen as fitting or failing to fit how the world really is at a brute level (Searle 2010: 13). When something is attempting to change how the world is and not merely representing how the world is, it is said to have a world-to-word direction of fit, which is an upward direction of fit (Searle 2010: 12). The most interesting cases are the ones which have both directions of fit simultaneously. These would be in the form of declarations because the declaration creates a state of affairs that is then brought into existence by the speech act itself. These special cases are what Searle thinks creates social reality and institutional facts (Searle 2010: 13–14).

Finally, institutional facts which do not require a community to collectively recognize them cause somewhat of a problem for the ontology of social reality (Searle 2010: 21–22). These facts are discovered by social scientists. While they may seem like they do not require actual institutions, they bottom out in institutional facts about the system of which that they are a part. A recession requires no immediate institution for it to exist, but without the trade cycle that is evident within the institutional structure of economics, there would be no such recession (Searle 2010: 22–23).

Having recounted some of the basics of Searle's social ontology, it is important to consider one of its weaknesses especially relevant to

<sup>3</sup>Most of this section of this entry is based on a more detailed versions found in Corlett (2016) and Corlett (2017a, b).

businesses. One such weakness in Searle's account of social reality stems from the absence of one fundamental feature: the lack of an ethically normative property. By this I mean that Searle's account fails to capture something basic concerning us as social beings, namely, that we often function as those who behave according to what we believe we ought to do or what ought not to be the case in this or that circumstance. This does not in itself provide a refutation of Searle's account, but it does suggest that the strength of Searle's epistemic justification is limited insofar as it fails to address competing views of human rights. While I recognize that there are a host of critics of Searle's social ontology and on a wide range of philosophical issues, I note that Searle's social ontology lacks a concept of moral normativity aside from what is institutional or what he refers to as "informal."

One implication of my critique of Searle's social ontology is that it fails to provide an ethically normative component which would ground values based in normative concepts, ethically speaking. This means that, while Searle's social ontology might explain part of what transpires in the social construction of businesses or businesses as social constructs, it omits the crucial ethically normative component of how such institutions ought to behave, and why, ethically speaking.

## Conclusion

Some basic relevancies and implications for the respective social ontologies of Gilbert, Tuomela, and Searle are clear. In the case of Searle's theory of social being, businesses are made real by way of social agreement by way of speech acts on the status functions of such organizations. But Searle's view lacks ethical normativity and thereby does not, for all he states, serve well for purposes of doing normative business ethics. In the case of Tuomela's social ontology, not much attempt is made to address ethical concepts and especially normative ones. Thus, somewhat like Searle's social ontology, Tuomela's is less relevant to and helpful for the aims of ethically

normative business ethics than one would desire. And Gilbert's theory of social reality is specifically intended to address matters of social and political philosophy. However, somewhat akin to Tuomela's social ontology, group members such as business officials cannot on their respective analyses exit the businesses to which they belong unless and until they receive permission from others in the business, presumably other business officials. But this restricts personal autonomy in important ways, making these conceptions of business group membership untenable. Gilbert's social ontology is the one most amenable to ethically normative business ethics. It is suggested that Gilbert and Tuomela each omit the requirement of a group member's having to receive the permission by other group members to leave the group in order to preserve the importance of personal autonomy in businesses. If this is done, then their respective theories can serve the basic interests of ethically normative business ethics rather well, other relevant things considered.

## Social Identity Theory

Lisa-Jo K. van den Scott

Department of Sociology, Memorial University of  
Newfoundland, St. John's, NL, Canada

### Synonyms

In-group/out-group; Social categorization theory

### Definition

Social identity theory is concerned with intergroup relations. As individuals learn to identify as members of particular groups, they may then favor their in-group (the group with which they identify) or discriminate against an out-group (groups to which they do not belong but to which they compare their own groups). If an individual finds him or herself in a group with low status, social identity theory posits the various ways in which an individual may respond, either by attempting to disentangle oneself from the group or to mobilize toward ameliorating the status of the group. Social identity theory lends itself to the study of cognitive categorization processes, stereotypes, and favoritism (in-group bias), although it has also been used to explore the deeper meaning of identity (individual vs. group) (Burke and Stets 2009; Stets and Burke 2000), the self in multicultural settings (Brown 2000), and group roles (Tajfel 1974).

### Description

Although the concept of racial prejudice as a result of group categorization and positionality, i.e., as a result of group process rather than an individual process, was presented by Herbert Blumer as early as 1958, social identity theory as its own entity emerged in the 1970s from the field of psychology and quickly extended into social psychology. Its focus was the role of “men in groups” (Tajfel 1974:65) rather than

the roles of individuals in groups. Studies initially sought to understand what the minimal conditions would be for intergroup discrimination to manifest itself (Brown et al. 1980; Tajfel 1974; Tajfel and Turner 1979). As the theory developed, in-group bias, “the tendency to favor the in-group over the out-group” (Tajfel and Turner 1986:13), gained attention as a key factor in intergroup relations. In the mid-1980s, Henri Tajfel and John C. Turner published a chapter in a psychology textbook which became the benchmark for social identity theory (Tajfel and Turner 1986). Although Tajfel is often acknowledged as the father of this theory, Turner and Rupert Brown were also key figures.

Social identity theory rests on the assumption that as people categorize others, and themselves, into groups, those group memberships form the basis of their social identity (Brown 2000). People act and react to people based on their own social identity and that of others. Tajfel and Turner define a group as “a collection of individuals who perceive themselves to be members of the same social category” (1986:15). Group membership, and the status and relational hierarchies of groups, impacts how we treat each other and is, therefore, particularly relevant as we consider discrimination and in-group bias.

Tajfel and Turner present three basic principles:

1. Individuals strive to achieve or to maintain positive social identity.
2. Positive social identity is based to a large extent on favorable comparisons that can be made between the in-group and some relevant out-groups.
3. When social identity is unsatisfactory, individuals will strive either to leave their existing group and join some more positively distinct group or to make their existing group more positively distinct (Tajfel and Turner 1986:16).

From these principles, they conclude that people will work at differentiating themselves by differentiating their social groups (Tajfel 1978)

either by stressing similarities within the group or differences from out-groups.

Overall, social identity theorists stress that the real world is messy and that people will fall along a continuum of acting as an individual and acting as a member of a group according to the “level of self” and the salience of group membership which the context engages (Tajfel 1974; Turner et al. 1987). Tajfel demonstrates that the two conditions which determine action “in terms of self or group” (1974:88) are the categorization of the social world into “clearly distinct and non-overlapping categories” (Tajfel 1974:88) and the firm placement of one’s social identity in a social group with no flexibility or opportunity for movement. The more these two conditions hold true, the more one acts in terms of group membership.

After a lull in the 1990s, social identity theory and the role of groups have rebounded in the last 20 years. The argument has been made that social identity theory and identity theory could be merged into one cohesive framework for understanding roles in society (Stets and Burke 2000). While Hogg et al. (1995) are skeptical and argue that these theories cannot be merged as the way roles and groups are treated is different, Stets and Burke (2000) view these theories as merely having a different emphasis, the first on groups and the later on roles, both of which implicate the other.

## Fundamental Concepts in Social Identity Theory

Scholars have organized their discussions of the concepts emerging from social identity theory around two areas: social categorization and its connection to self-esteem, and in-group bias and out-group discrimination.

### Social Categorization and Self-Esteem

Rather than study intergroup relations by studying the views and treatment of various groups toward each other, social identity theory recognizes that before these beliefs and behaviors develop, people must first “have acquired a sense of belonging to a

group which is clearly distinct” (Tajfel 1974:66) from themselves. There are three key phases: categorization, social identification, and social comparison (Tajfel 1974).

First people categorize, i.e., “segment, classify, and order” (Tajfel and Turner 1986:15), people into groups to make sense of our social environment. Stets and Burke point out that categorizing (2000) can lead to group polarization (Wetherell 1987) or group cohesiveness (Hogg 1987). Once people categorize themselves and others into in-groups and out-groups, their social identity is rooted in this categorization. Next, as people come to understand their social world as a constellation of social groups, they take on a social identity according to their group membership(s). Lastly, attributes are ascribed to groups through comparison with other groups. Categorization, then, eventually leads to stereotyping (Brown 2000). Members within a group are understood as more similar to each other than to those in other groups (Tajfel 1969 cited by Brown 2000), emphasizing intragroup similarity as much as the homogeneity of other groups (Brown 2000). Status is then “the *outcome* of intergroup comparison” (Tajfel and Turner 1986:19) and follows after categorization. Attending to distinctiveness among groups, creating difference among groups, provides order and meaning (Tajfel 1974).

People will then work toward a positive image of himself or herself (Tajfel 1974) from the vantage point of their social identity (Brown 2000), seeking a positive social identity. Within this literature, this is often framed as working toward positive self-esteem. High self-esteem is correlated with positive social identity. There are two ways to increase self-esteem. First, one can increase or emphasize the positive status of one’s own group. Second, one can discriminate against other groups. The results of this can be minimal or far-reaching in cases such as genocide (McLeod 2008). “The aim of differentiation is to maintain or achieve superiority over an out-group on some dimensions” (Tajfel and Turner 1986:17).

### In-Group Bias and Out-Group Discrimination

Following up on the self-esteem argument, the argument that individuals will act in ways which

increase positive social identity, in-group favoritism has garnered attention. Tajfel (1982) discusses this as ethnocentrism. In the initial studies, there was a surprise at how minimal the conditions needed to be for in-group bias to manifest (Brown et al. 1980; Tajfel 1974). Considering, however, the push for positive distinctiveness, the presence of in-group bias makes sense.

Studies find that individuals feel “better about themselves” (Brown 2000:747) after engaging in in-group bias which differentiates among groups and increases a sense of positive social identity in the individual (Rubin and Hewstone 1998), reaffirming for him or her that he or she is a member of the positively perceived group. Brown (2000) points out that this explanation of in-group bias helps to explain it when other theories around resource distribution fail. He also points out that motivation does not always equal the intended results (Brown 2000).

Should one have the misfortune of being categorized as a member of a lower-status group, keeping in mind that hierarchies of groups are relational, the permeability of the group membership sets the conditions for their response. If the individual has some opportunity for mobility among groups, he or she may try to distance him or herself from the original group (Tajfel and Turner 1986). If there is no opportunity for mobility, “no cognitive alternatives of any kind available to challenge the existing reality” (Tajfel 1974:77), then the individual must push for collective action by the group. They may try to compare groups along new dimensions or to compare their group with a different group where the outcome will be more favorable. They may also try to push for a social movement which would elevate the group’s status (Tajfel and Turner 1986). If, however, even a few are able to disengage from the group and become aligned with another, more successful, group, then the conditions for collective action do not hold (Brown 2000). Brown (2000) thus argues that group identification, rather than relative deprivation, can best predict collective action.

## Summary

At its heart, social identity theory is “a theory of group differentiation: how group members can make their ingroup(s) distinctive from and, wherever possible, better than outgroups” (Brown 2000:757). Social identity theorists focus on the conditions for in-group bias and out-group discrimination, starting from the point of categorization of groups, the consequential acquisition of a social identity (self-categorization), and the resulting social comparison among groups. Social identity theorists have worked primarily on categorization, self-identification, in-group bias (self-esteem and/or favoritism), stereotyping, and discrimination.

Continuous acceptance

The social license to operate concept originated in the mining industry as a metaphor, which

compares the power of communities with the power of governments.

During the 1990s, the mining industry found itself under close public scrutiny following a series of well-publicized chemical spills, tailings dam failures, and increasing conflict with local communities around exploration and development projects (see Thomson and Joyce 2006, for a review of this time period). In 1996, a Roper opinion poll showed mining to rate last among 24 US industries in terms of public popularity, behind the tobacco industry (Prager 1997). Internationally, mining became a pejorative term in many circles and widely regarded as a problem industry that was the cause of unwanted pollution and undesirable social impacts. This reputation was deeply rooted in the general public and widely shared by opinion formers and constituted a liability to the industry (Schloss 2002). At the same time, in the rapidly emerging process of globalization, local communities were increasingly able to mobilize support and assistance from influential allies at home and abroad. Mining companies could no longer ignore the concerns of communities and their supporters without risking local conflict with consequential financial and reputational damage.

It was within this context that, at a meeting with World Bank personnel in Washington in March 1997, Jim Cooney, then Director, International and Public Affairs with Placer Dome, noted a structural shift in the nature of political risk and that going forward mining companies would have to manage two complimentary dimensions. One dimension would be the management of conventional political risk through compliance with permits and regulations backed by cultivating a positive relationship with governments to obtain and maintain the government-granted legal license to operate. The second dimension would be the management of the rapidly rising risk of conflict with local communities. To successfully address this dimension, it would be necessary to engage with local communities and other stakeholders affected by a mining project. By building and maintaining a positive relationship with them, it would be possible to gain their approval (or at

least acceptance) to establish and operate a mine: a parallel “social license to operate” (Cooney 2017).

The concept of a social license to operate surfaced in May 1997 in discussions within a conference on Mining and the Community in Quito, Ecuador, sponsored by the World Bank (G. McMahon personal communication), and soon entered the vocabulary of the industry, the civil society, and the communities that host mines and mining project. The concept of a social license to operate and its role in reducing the risk of social conflict at mining projects first appeared in print in the June 1999 issue of *Mining Journal* (Joyce and Thomson 1999).

At the level of an individual mine or mining project (including exploration projects), the social license is rooted in the beliefs, perceptions, and opinions held by the local population and other stakeholders about the mine or project. It is therefore “granted” by the community. It is also intangible, unless effort is made to measure these beliefs, opinions, and perceptions. Finally, it is dynamic and nonpermanent because beliefs, opinions, and perceptions are subject to change as new information is acquired. Hence the social license has to be earned and then maintained (Joyce and Thomson 1999, 2000; Business for Social Responsibility 2003; AccountAbility and Business for Social Responsibility 2004; Nelsen and Scoble 2006; Thomson and Joyce 2008; Thomson and Boutilier 2011).

The most fundamental meaning of the social license is *continuous acceptance* (Business for Social Responsibility 2003; AccountAbility and Business for Social Responsibility 2004) or *approval* (Nelsen and Scoble 2006) or *both* (Joyce and Thomson 1999, 2000; Thomson and Joyce 2008) of a project by the local (host) community and other stakeholders. The usage of the term “social license” has now spread from mining to infrastructure projects, business activities, and industries such as adventure tourism (UNWTO 2014), aquaculture (Leith et al. 2014; Quigley and Baines 2014), farming (Berger 2011; Martin and Shephard 2011), forestry (Wang 2013), fracking (Smith and Richards 2015), oil and gas exploration and production (Thomas 2013),

pipelines (Tertzakian 2012), ports (Ircha 2012), pulp and paper (Gunningham et al. 2004), renewable energy (Corscadden et al. 2012; Hall 2014), retailing (Graafland 2002), stem cell research (Raman and Mohr 2014), and water use (Shephard and Martin 2008). Barreiro-Deymonnaz (2013) expects that the social license will become a key concern for the construction industry as social pressures increase on governments worldwide to raise environmental and social standards for construction projects.

While there are many issues that generate conflicts with stakeholders, the social license to operate concept narrows the perspective to the most basic challenge of obtaining the acceptance of a community to initiate or continue an activity. The social license is a complement to regulatory licenses and cannot be delivered by any formal political or legal authority. Indeed, Morrison (2014) contends that the concept of social license is relevant to all organizations in society, including governments and non-governmental organizations (NGOs). He notes that while governments draw considerable legitimacy from their sovereign power and recognition among the community of states this does not mean they will have de facto legitimacy (and hence acceptance) in the eyes of all communities and other stakeholders (Morrison 2014, page 60). Similarly, the legitimacy (and hence acceptance) of non-governmental organizations cannot be assumed either (Morrison 2014, page 60).

What makes the social license different from exhortations to stay within the ambit of socially acceptable activities is the recognition that stakeholders can have power (Boutilier 2014). When a social license is withdrawn, stakeholders can use that power to obstruct a project making continuing operations more costly or even shut them down. Obstruction tactics have included the blockade of roads, the withholding of vital supplies and services through strikes, the restriction of market access through boycotts, and even direct violence through armed robbery, sabotage, kidnapping, and murder and have resulted in the withholding of legal licenses and demands from financiers for a risk premium.

The academic pedigree of the concept of “social license to operate” comes from the resource dependence theory (RDT) of the firm and stakeholder theory. The RDT has been prominent among organizational theories addressing the changing nature of struggles for power, autonomy, and, ultimately, resources broadly defined (Pfeffer and Salancik 1978; Wernerfelt 1984; Barney et al. 2001; Casciaro and Piskorski 2005; Gulati 2007). The basic insight is that companies depend on external parties for the resources they need to operate and therefore are motivated to reduce uncertainty in resource access through practices that reduce its dependency or reduce the uncertainty associated with its dependency. The theory accounts for corporate strategies that cannot be explained by the quest for efficiency or economic rationality, such as some instances of interlocking boards of directors, mergers and acquisitions, outsourcing, joint venture subsidiaries, joint research and development, shared marketing arrangements, minority investments, equity swaps, and licensing and franchise agreements. Because investments in stakeholder relations are examples of uncertainty reducing activity, the concept of the social license can be viewed as a RDT project management tool.

The concept of social license also integrates concepts from stakeholder theory (Freeman 1984). The original definition of stakeholders is those groups or individuals who can affect the firm or who can be affected by it. A common mistake in identifying stakeholders is to assume that the company can decide unilaterally who its stakeholders are (Boutilier 2014). It is more accurate to say that a company tries to discover who all its stakeholders are. In the process the company must be careful to include those who are at risk of being affected even if they have not yet experienced impacts. Likewise, those who have not yet taken any action but who could impose an impact on the firm must also be counted as stakeholders. Companies can then decide which stakeholders to prioritize for initiatives that will raise or maintain the level of the social license.

Thomson and Joyce (2008) applied a grounded theory approach (Glaser and Strauss 1999) based

on a large number of interviews to identify the normative components of the social license as comprising the community/stakeholder perceptions of the legitimacy and credibility of the mine or exploration project and its operator and the presence or absence of true trust. Further, they suggested that these elements are acquired sequentially and are cumulative in building toward the social license. The mine or project must be seen as legitimate before credibility is of value in the relationship with the operator of the project, and both must be in place before meaningful trust can develop. As a consequence, the social license can be thought of as having distinguishable levels (Thomson and Boutilier 2011). At the same time, the process of moving from one level to another can be thought of as a smooth gradient of continuous relationship improvement through increasing social capital, which opens the opportunity to measure the relative level of the social license granted by the community and other stakeholders at any given project (Boutilier and Thomson 2011). Black (2013) has developed a measure of the social license for the mining industry, which, in turn, enhances an instrumental approach to managing company-community/stakeholder relationship and sociopolitical risk (Demuijnck and Festerling 2016).

The social license concept has been the subject of numerous studies and guidelines that give concrete advice about how to improve relations with stakeholders, which amounts to raising the level of social license. For example, Deephouse and Suchman (2008) offer an analysis of legitimacy perceptions that can be used as a for guide action aimed at recuperating a social license. Similarly, Mele and Armengou (2016) illustrate how moral legitimacy can become significant in controversial projects. In the construction industry specifically, Smyth (2008) has argued the benefits of empowering community stakeholders as a way of dampening the outrage factor and engaging stakeholders in constructive collaboration. Working together (a) has been shown to increase social capital in its sense of creating high trust network ties (Brown and Ashman 1996), (b) has long been recognized as a method for reducing intergroup

conflict (Sherif 1966), and (c) has proven its effectiveness in gaining stakeholder acceptance for projects (Zandvliet and Anderson 2009). Although there are many frameworks for improving stakeholder relations and thereby improving the level of social license, these are not part of the social license concept itself. By itself, the social license focuses attention on monitoring the quality of relationships with stakeholders who control or influence access to vital resources.

## Introduction

The pervasive use and engagement with the Internet and social media has become an integral part of both our personal and professional lives. Social media are defined as Internet-based applications and platforms which allow users to create new content such as Wikipediaes, blogs, social networking profiles, and personalized websites. These can include both personal (e.g., Facebook) and professional (e.g., LinkedIn) social media platforms. Statistics show more than two billion people worldwide use social media daily. Social media platforms facilitate exchange of information and building of relationships by reducing the barriers to communication that existed before the advent of the Internet. However, challenges emerge when the traditional boundaries between personal and public networks and relationships are blurred, and information may be accessed during the job search that the individual intended to keep private.

Social media increasingly serve an essential communication channel in the workplace and can support, as well as undermine, many human resource functions, such as recruitment and initial screening of candidates. Technology has given employers significant control over access to information about employees and job applicants.

Unfortunately, the adoption of social media for a wide range of human resource (HR) processes has far outpaced the evidence-based justification for these emerging practices. In fact, most of the empirical research to date on the use of social media in the workplace focuses on respondents' reactions to the use of it, rather than the reliability, validity, utility, and/or efficacy of its use in HR practices such as recruitment, screening, and selection. Therefore, it is important for users to understand both the current and potential benefits of accessing social media for HR practices such as recruitment, as well as the clear challenges and risks of doing so. What follows is a summary of many of the key concerns and issues related to using social media for employment screening and recruitment in organizations and teams.

### **Identifying and Attracting Job Applicants Through Social Media**

Employers in the twenty-first century have the option to post open positions on a wide variety of social media platforms. Employers often favor certain platforms over others to identify qualified candidates for open positions. For example, employers seeking to attract candidates from an international audience are more likely to use globally recognized social media platforms, whereas domestic or regional employers rely on national or regional social media platforms. Limiting recruitment by using specific social media platforms could have important implications for the diversity of the applicant pool obtained.

Recruiters may also be more active, rather than passive, by using relevant search terms on social media platforms to directly reach out to potential job applicants. However, being more active could also lead to unearthing potentially irrelevant information that could affect the employment processes in unintended ways. In addition, applicants may misperceive the level of control they have over the information available on the Internet related to them. For example, friends and colleagues can "tag" individuals in ways they are

not aware of on social media posts, which could negatively impact the applicant's online presence in the eyes of recruiters and HR managers.

### **Cybervetting**

Cybervetting is increasingly used to review applicants' online profiles and Internet activities. These electronic, often unsystematic, employment-screening procedures are typically applied at the initial stages of the employment process after candidates apply for an open position. This is based on the rationale and hope that such screening can ensure that applicants who are ultimately selected are more productive, are less likely to leave, and have a temperament and work ethic that will be a good match for the employer and culture of the organization. In addition, some organizations operate from the perspective that one's off-work behavior is important in that it can impact the image of the organization and how well employees are deemed to represent the organization. With this perspective, they hold the belief that accessing the private social media of applicants is their right and responsibility to preserve their image. However, as noted above, there is yet little empirical evidence that supports using social media in a valid way to make accurate interpretations of the information for selection purposes. In addition, employers may not be using a systematic procedure to gather and evaluate the online information. Without using clear criteria when reviewing online information, the ratings of candidates are likely to reflect the biases of the recruiter or HR manager rather than provide an accurate picture of the talents, abilities, and character of the individual applicant.

Note that applicants can also cybervet potential employers during the application and recruitment process by reviewing social media platforms such as Glassdoor. Thus, cybervetting is clearly a two-way street, where the tech savvy applicant may be able to unearth a treasure trove of information on a potential future employer, from official company documents to Yelp type reviews of what it is like

to work for a given employer. As with employer's cybervetting potential applicants, the potential applicant needs to be wary of the authenticity and veracity of the information obtained from various social media websites about future employers. Use of tenuous information on social media platforms by potential recruits could significantly alter their decision-making process with regard to future job offers.

Given the exponential growth in available social media data, many employers are increasingly using artificial intelligence (AI) to screen potential applicant's social media profiles. AI may miss common synonyms for key terms in social media information. For example, someone may note that they are *flexible*, but the AI algorithm used may be searching for the term *adaptable* instead and thus miss an otherwise qualified potential applicant.

Another potential issue is that professional social media platforms such as LinkedIn are likely to be populated with white collar professionals, more than blue collar-skilled crafts people or laborers. They are also likely to be more prominent in some professions more than others. In addition, many individuals may have a nonlinear career or change career paths multiple times during their career. As a result, their digital footprint may not be as relevant to their current career pursuits as someone who has followed a more traditional, linear career path.

## Privacy, Ethical, and Legal Issues

Traditionally, the job applicant has been able to control the type and amount of information that employers see about them via submitting résumés and job applications. However, job applicant's digital footprint on the Internet continues to grow as their career unfolds, and for workers early in their career their digital history starts at younger ages than just a decade or so ago. Thus, employers using AI to recruit and screen potential job applicants may see social media posts and other online activities that the applicant would

rather the potential employer not see. Unfortunately, it can be extremely difficult to delete, let alone permanently erase, such unwanted information on social media web site.

Additionally, there are many ways to include information in one's profile to aggrandize and put one's best foot forward. What is posted online may be done with the intent to impress hiring managers and highlight the positive experiences, backgrounds, talents, and skills of the individual. There are many available resources online that provide suggestions and recommendations on how to enhance your profile and online presence. The consultants and practitioners who provide coaching and recommendations have integrated the best practices of optional profiles and guide job seekers to create a positive image. While this is part of the interview process (putting your best foot forward), recruiters and hiring managers cannot make the inaccurate assumption that what is online is in some way more accurate or a more complete picture of the job applicant. Impression management and the desire to share only specific information need to be an important consideration when information is gathered about job candidates via online data sources.

The power imbalance between job applicants and employers can also raise privacy, ethical, and legal concerns regarding using social media for recruitment and initial screening of job seekers. For example, there have been reports of employers demanding job applicants provide the employer with login credentials for their social media accounts so that the employer can access all information regarding an applicant's private social media profiles, not just what is available publicly about the individual. Access to demographic information, such as age, race, gender, marital status, number of children, religious affiliation, and disability status, clearly raises legal concerns about inappropriate data being used in the employment process. This is a legal issue (in terms of protected classes under US Federal and State laws), as well as a process which can severely impact diversity and inclusiveness of hiring and onboarding practices.

When using any data to evaluate job candidates, relevance to the position and the work the individual is being hired for is essential. Without clearly established criteria for the position, applicant data viewed on social media is evaluated through the biases of the individual recruiters who are screening candidates. Using AI, as an initial screening tool, can help reduce bias if the screening algorithm is carefully developed and directly linked to the selection criteria.

## Conclusion

While the ever-increasing popularity of both personal and professional social media tools has made it much easier for employers to both actively and passively recruit potential job applicants, it has also opened a Pandora's Box of potential legal and ethical concerns regarding screening job-relevant information on job applicants. However, when recruitment methods and evaluation approaches gravitate away from validated selection processes toward unvalidated approaches such as using social media to screen applicants, it is not clear how the approaches meet established standards of ethics and professional codes of conduct. To meet established standards, training is essential to ensure that an ethical and valid recruitment and selection process is utilized that minimizes bias and reduces adverse impact. When applicants are asked to provide access to private social media accounts, they may feel vulnerable and are not able to refuse these requests for fear of putting their chances of getting the job at risk.

Employers are in a position of power to make these requests and access the information as they see fit in the recruitment and selection process. Often, managers and recruiters believe that they can discern more specific information about a candidate's personality and character through information posted on social media. Believing that they are a good judge of character can cause managers and recruiters to misinterpret the information posted on social media sites. In addition, this belief masks the likelihood that individuals

may indeed behave very differently in the context of work versus the actions in interactions that they focus on when posting on social media sites that highlight outside work relationships and events. Without clarity on the criteria and completion of validation research about the specific information obtained from social media and how it is related to performance on the job, the ethical use of social media data is questionable at best.

## Social Media Speech and the Workplace

David Mangan

School of Law and Criminology, Maynooth University, Maynooth, Ireland

### Synonyms

Business reputation; Employees' free speech; Online speech

### Introduction

Social media platforms offer individuals an unprecedented opportunity to express themselves. Individuals choose not only what to post, but also the audience to which they are posting. Comments, photos, videos, and stories may be shared with selected individuals, or they may be made public so that these remarks show up through random online searches. Overall, social media has had a profound cultural impact (van Dijck 2013). Social media speech, however, poses significant challenges for workplaces in democratic jurisdictions.

Free speech remains a championed value in many democratic countries (Milo 2008). And yet, the value of free speech is not necessarily as warmly embraced within the walls of the workplace. Social media has further complicated the concept of the workplace by adding an online dimension to the physical. This topic draws from legal analyses where attention is focused on the competing interests of employers and employees.

### The Force of the Employment Contract

The terms of an employment contract may constrain employees' freedom to express online. This situation is attributable to the subordinate nature of employment. Employers benefit from their (or their legal representation) drafting of contract

clauses regarding social media use. These provisions vest employers with the unilateral authority to determine whether online remarks or activities harm their business interests. This power includes an assessment of whether employees' online comments reflect negatively on employers' business reputation. These clauses also expand the bases for which workplace discipline (up to and including termination) may be levied. The breadth and strength of these contracts derive from the frequency with which courts or arbitrators enforce these social media provisions. In effect, the scope for workplace discipline extends beyond the physical location of work to include online activity, and beyond the workday to include off-duty conduct.

### Balancing Employers' Business Interests and Employees' Free Speech

The task for courts and arbitrators is to balance employers' and employees' interests. The power vested in employers by employment contracts is not of itself a matter for opposition. Rather, the question is whether these contract clauses create a chilling effect by policing behavior that is unconnected (or of arguable connection) with employers' businesses, through the prospect of workplace discipline.

Protection of business interests is a legitimate aim. Social media usage connected to work poses practical concerns to business reputation stemming from the potential for remarks on the Internet being shared. The assessment of harm, however, remains ambiguous where employers are not required to establish actual harm to business interests. The interpretation of the negative potential effect on business reputation of employees' social media remarks stands out as a particularly challenging, yet salient, issue. Moreover, the capture area for perceived harmful remarks by employees extends well beyond comments made at the workplace on social media and includes statements outside of work that employers determine to be embarrassing to their interests.

Employees' free speech forms the other competing interest in this balancing exercise. Taking instruction from the spectrum for interpretation of employees' remarks above, employees' free speech can be a contingent concept. There are different forms of speech which may be connected, in some manner, to work, including whistleblowing, political speech, principled dissent, and general comment (Vickers 2002). Employees' free speech, though, contains several considerations that render it a more complicated point of analysis.

One factor is that social media comments have been situated within a hierarchy of speech. Political speech has a prominent place (sometimes classified as high-level discourse), but protected speech consisting of it alone seems to be too narrow a construction of free speech. The language of low-level speech has been applied to social media remarks (Rowbottom 2014). By way of example, the UK Supreme Court has characterized online speech as warranting less scrutiny: that "it is wrong to engage in elaborate analysis of a tweet . . . The imperative is to ascertain how a typical . . . reader would interpret the message. That search should reflect the circumstance that this is a casual medium" (*Stocker v Stocker* (2019) UKSC 17, para.43).

The importance of expression to the individual forms another consideration that creates tension with the place of social media remarks within a hierarchy of speech. Employees' expression has been set within a self-development context that has garnered legal protection. Decisions of the European Court of Human Rights illustrate this point (see *Lingens v Austria* (1986) 8 EHRR 407).

The self-development dimension of employees' speech requires some nuanced treatment. Motive is one consideration. Employees' social media postings aimed at ridiculing employers are not treated in the same manner as similarly intended social media postings about government. The former attracts a duty of loyalty and fidelity that tempers employees' freedom to express, when weighed against employers' interests. Whistleblowing is another example drawing from motive. An individual posting comments first on social media, without making the

employer aware of the issue, may not easily fit within the whistleblowing framework. If attention has been drawn to the employer without any subsequent action taken and the individual acts in the good faith belief that the information in question is true, then there may be a public interest in disclosing it where no other more discreet means of addressing the matter is available (see the European Court of Human Rights in *Heinisch v Germany* (2011) ECHR 1175).

A matter adjacent to the present topic but still of importance, social media companies have become powerful entities themselves that can limit social media speech in relation to the workplace. The more users that have signed up to a particular platform, the more important that medium becomes. This "network effect" of social media platforms has also precipitated a less idealistic outcome that has attenuated the breadth of topics for communication. The triggering of a "report and takedown" protocol has provided a unique means of stifling commentary by making false accusations about commentators. As an example, Tufekci (2017) explored the strategic use of such protocols in relation to the "Arab Spring."

## Surveillance of Employees' Online Speech

How do employers learn of employees' social media remarks?

In some instances (where employees provide some indication of their employment and their comments are made public in some way), employers are notified of online remarks by other workers or even members of the public. This form of reporting is a by-product of the facilities provided by social media. The ease in this form of reporting can also be seen in platform work or "gig work" where the assessment of work completed has been outsourced to consumers. Reporting online remarks by employees conveys a conformity dimension since co-workers or the public are judging the speech to be inappropriate. In this context, the act of reporting these employees is a significant step.

Computer software is available that enables employers to view employees' online activities. This has been largely done onsite where employees use employer-provided computers, though technologies such as GPS permit location monitoring. With the Covid-19 pandemic, there have been reports of such surveillance being undertaken by employers while employees have been working from home.

Scrutiny over the intrusion into workers' privacy rights by the ways in which the information comes to employers' attention (particularly employers' active surveillance measures) has been curbed. Part of the reason has been a perception that if comments are made on social media, then any privacy right has been waived. The premise remains a matter of debate (Finkin 2018). The supposition relies on the assumption that all comments made online are public, ignoring the possibility of privacy settings (for example) or more directed communication to a select audience. Recalling the last section, in the employment setting, it is the potential not the actual detriment that is the basis for discipline.

### **Social Media, Speech, and the Toxic Workplace**

Social media offer businesses both possibility and peril. On the positive side, social media represent an opportunity for consumer engagement. These media present service providers and manufacturers of goods with a unique possibility of building a relationship with consumers (even goodwill) by regular social media postings. This same possibility also poses a risk that requires attention.

Social media extend the physical workplace to the online domain. If social media is akin to a conversation, then unsavory remarks orally made in workplaces can now often be viewed online (Mangan 2018). Even if it is posted outside of work hours and away from the physical workplace, the remark can contribute to a toxic workplace. Employment contracts likely contain provisions that touch upon employers' having a workplace which promotes respectful interactions and is free from discrimination and harassment,

thereby granting employers the authority to take disciplinary steps for such remarks.

The toxic workplace is not simply a matter of managing the workforce. A business' social media presence that is interactive with the public would need to also be a space free of racist, sexist, homophobic, and otherwise offensive language. This means that if consumers interact with business personnel and a consumer (for example) posts a sexist remark about a female employee to the business' Twitter feed, the business may be responsible to that female employee if it does not remove the remark. Imbuing social issues with legal implications by way of social media speech may be one of the most engaging, controversial, and important matters to be taken up by the intersection of user-generated content platforms and employment.

### **Social Media Speech as Work**

The focus to this point has been on social media speech as a source of contention within the workplace, as well as the extended notion of what affects the workplace with social media platforms. Another aspect of this topic is that social media speech may itself constitute work. The following paragraphs consider two examples: social media influencers, and social media as an additional facet of existing work.

Social media influencers are individuals who produce content for social media (Goanta and Ranchordás 2020). Often, they have a presence on the most widely used platforms. This content consists of short videos or photos that speak to an audience in a personal manner. Through this content, influencers grow in popularity (measured by the number of followers they have). The most well-known influencers have followers numbering in the millions. The capacity to influence a large following is the essence of being a social media influencer because influencers earn income for their postings from manufacturers and retailers.

Influencers may also be employees. Public-facing businesses may tap into their existing workforces by setting up social media accounts

featuring their own employees speaking about goods. The perceived appeal is that these employees are relatable to consumers. These employees may also have their own social media accounts that combine with the company's online profile. Significant questions arise about the boundary between work/private life.

Social media may have also intensified existing jobs. Some positions now entail a social media presence as part of the work. In addition to the physical work of a job, such as meetings, report writing, and maintaining up-to-date knowledge, employees may additionally need to have an online presence which is facilitated by social media postings. These individuals need not necessarily be at the level of social media influencers, but part of their work may obligate these employees to be seen within the spectrum of online commentaries. Social media speech as an additional facet to a job speaks to the embedded nature of social media within day-to-day life.

## Social Norms

Marcos Fanton, Bruno Pinheiro Costa and  
Juliano Pires da Rosa  
Universidade Federal de Santa Maria (UFSM),  
Santa Maria, Brazil

## Synonyms

Collective normative behaviors

## Introduction

The social norms approach is an emerging field of research with a wide interdisciplinary scope. Areas such as psychology, economics, philosophy, sociology, health sciences, information science and marketing have used this approach to understand and diagnose collective behaviors. This kind of approach is based on the premise that certain behaviors are determined by normative attitudes and expectations shared among individuals of a social group in a particular context. The central problem of social norms theories is to understand how these sociocultural determinants affect collective behaviors. The correct understanding of these determinants can be useful to design better and more efficient models of intervention that aim to modify social behaviors.

## Social Norms, the Grammar of Society

Social norms are usually defined as the “grammar of society.” As a grammar, they are publicly shared informal rules that express acceptable and prohibited behaviors in social groups or society.

The normative aspect of this grammar is established through a continuous process of social interaction. Over a period of time, these interactions incorporate society's desires and values forming rules of collective behavior without prior or conscious design. The distinctive feature of social norms is the way they regulate our behavior through a dynamic of sanctions and normative expectations. (Bicchieri 2006, p. 1)

Some social norms maintain prosocial behaviors, reinforcing essential values for society, such as tolerance and mutual respect, trust, cooperation, and justice. However, others can foster harmful and discriminatory behaviors toward certain individuals or minority groups by imposing stigma, stereotypes, or limiting their liberties. In the latter cases, social norms may have consequences on participants' health and well-being (Edberg and Krieger 2020; Cislighi and Heise 2018).

Despite a wide variety of social norms theories, there are some consensual points in the literature on the concept of "norm." Social norms and similar concepts are not mere behavioral regularities. In this purely statistical sense, the description of what is familiar and common in a society or group is disregarded in the investigation, when they lack influence or normative content. Social norms are not instinctive behaviors or reactive natural attitudes such as sneezing, yawning, or running away from something we fear. Nonetheless, researchers tend to agree that social norms, as the name suggests, should be somewhat social, that is, shared by groups or society (even if there is a disagreement about the meaning of "social"). These rules of behavior emerge from social interactions among human beings; they are not considered as natural or divine commandments (Legros and Cislighi 2019).

We can find further disagreements on relevant topics of the theory of social norms. There are discussions on the proper definition of social norms, their dynamics, and evolution, the different pathways of influence from norm to behavior, and the different types of agents that should be regarded in the studies (Legros and Cislighi 2019; Edberg and Krieger 2020). For the purposes of this entry, we shall focus on the theoretical

framework established by Cristina Bicchieri (2006, 2017). Other approaches are suggested in the Reference section.

The main goal of the social norms approach is to understand the nature, structure, and dynamics of collective behaviors. Nonetheless, not all behaviors are governed by social norms or trigger social sanctions. Their nature is determined mainly by how individuals relate to them and their reasons for establishing such relationships. Therefore, there is no way to identify the type of behavior if we do not know the (explicit or implicit) reasons why individuals engage in it. According to a classic example from the philosopher Gilbert Ryle, a wink can be interpreted both as a natural reflection of the human body (an involuntary twitch) or as a means of communication (a conspiratory winking to a compliance). In the latter case, we must acknowledge that the signaler deliberately winked to send a message according to a code mutually known (Ryle 2009)

Bicchieri's theory offers analytic tools to assess and evaluate the nature and dynamics of collective behaviors, which ones are decomposed into four main elements: preference, expectation, context, and reference network. Since all these elements refer to social agents, not groups or social structures, this approach reduces patterns of collective behaviors in terms of properties of social agents (Brennan et al. 2013, p. 22).

Preferences are dispositions to act in a certain way in similar contexts. They are highly correlated to the choice of doing something based on the comparison of available options. I have a preference for A over B or C if, in a situation of choice, I choose A, not B or C. Preferences are classified according to two dichotomous factors (individual/social and conditional/unconditional). Strictly individual and unconditional preferences are not influenced by other people's behavior or expectations, whereas social and conditional preferences are (the other two pairs of preferences are irrelevant for this entry). (Bicchieri 2017)

Beliefs and expectations are also classified into four types. Factual beliefs are related to states of affairs or how the world functions. Personal normative beliefs express an individual's opinion about how the world should function. They

generally indicate the individual's normative attitudes toward something. The other two types of beliefs are social expectations about other people's behaviors and beliefs. Empirical expectations are defined as social beliefs about how people mostly behave or will react in certain situations. Finally, normative expectations are expectations about other people's normative beliefs. In other words, they are expectations about how other people will judge our behavior in normative terms (appropriate or inappropriate, right or wrong). Therefore, normative expectations are considered second-order beliefs and are usually accompanied by an indirect evaluation.

The theory of social norms distinguishes preferences and choices from attitudes. Attitudes are personal dispositions to evaluate something as good or bad. They are usually measured along a scale of favor/disfavor, like/dislike through a neutral point (Fishbein and Ajzen 2010). In many cases, a person may negatively evaluate a social practice, but simultaneously engage in it because she has conditional social preferences. Her behavior is conditioned by second-order beliefs, which concern other people's normative beliefs toward her. Classical research focused on alcohol consumption by college students, the practice of female genital mutilation, child marriage, and corporal punishment used against children by parents share these characteristics. The prevalence of the practice does not reflect the support of the practitioners.

Social norms do not always require rational deliberation to their application. They are triggered through salient clues that indicate to the agent the appropriate behavior for a given situation. Thus, social norms are embedded in contexts. The right interpretation of a series of clues and cognitive shortcuts are paramount for the correct categorization of the situation and the activation of the correspondent beliefs, schemas, and norms. Once this interpretation or the lack of salient clues fail, norms may not be perceived by the agent and the situation may be erroneously categorized (Bicchieri 2006, Chap. 2). Different approaches call social norms with a slightly different nomenclature: injunctive norms (Cialdini et al. 1991).

Reference networks express the set of individuals whose preferences and expectations matter for the decision maker. These individuals vary from merely local and close or even spread and not directly related persons. Depending on the context, relatives, neighbors, friends, co-workers, television artists and influencers, politicians, and religious or community leaders may be part of someone's reference network. In a research, it is a must-step that identify the corresponding reference network of relevant persons whose behaviors and expectations the decision maker cares about.

Thus, depending on the type of preference, expectation, context, and reference network, we will have different patterns of collective behaviors. Bicchieri (2006, 2017) develops a taxonomy that includes four main types of behaviors: customs, moral norms, descriptive norms, and social norms. It is important to note that these concepts are built for identifying and measuring the main social determinants of collective behavior. These static notions are not directly observable in reality. Usually, social practices are constituted with a variety of reasons to conform to it and their dynamics may change over time and space.

Consider, for example, the use of umbrellas (Bicchieri 2017, p. 15). Why do people use umbrellas? Indeed, we find no moral imperative for their use nor moral emotions (like resentment or anger) toward people who do not use them. At the same time, umbrellas are handy and almost everyone regularly uses it in rainy weather. The satisfaction of individual personal needs justifies its use: not getting wet in the rain. People do not care so much about what others will think about it or the regular and massive use of umbrellas. Therefore, people who use it sustain unconditional individual preferences. In other words, their behavior is not conditional to the behavior of others or their expectations. This individual habitual behavior will generate a custom, since people have the same necessity (in this case, not getting wet in the rain). Thus, *customs* are patterns of collective behavior sustained by unconditional individual preferences that satisfy individuals' needs. As counter-intuitive as it may seem, in light of Bicchieri's theory, customs are understood

as independent behaviors whose individual practices may lead to a collective pattern.

*Moral norms*, as well as customs, are independent behaviors. Moral norms are often defined as impartial and universal imperatives. From Bicchieri's perspective (2017, p. 31; Brennan et al. 2013), this means that a subject which follows a moral norm acts according to unconditional preferences and normative personal beliefs. The context and the reference network are suspended, because it does not matter with whom or on what circumstances we are facing to act morally. Someone may prefer not to eat animals under all circumstances, even if people around her are doing it. Someone may refuse to act unfairly, even if she fears punishment from her corrupted peers.

The situation is very different when it comes to interdependent behaviors. Unlike customs or moral norms, there are social practices that only exist due to conditional preferences. An individual may conform to a particular pattern of behavior only upon the belief that others behave just like that. These empirical expectations are expectations about what others are doing or how they behave that justifies someone's behavior. When we condition our preference only to the extent that we believe that people in our reference network conform to it, we have a situation where the leading social determinant is *descriptive norms*.

Imitation is a particular kind of descriptive norms. Someone expects that others will act in a certain way and thus conditions her behavior to them. However, the opposite is not the case. Trendsetters or social media influencers are followed by thousands and millions of people, without coordinating their actions or their expectations with their followers. The dynamics of imitation function through these unilateral expectations. In more trivial and day-to-day situations, descriptive norms relieve the costs of knowledge acquisition when we face new or unexpected situations. By observing others behavior and imitating them, we gather rapidly and almost costly guidance of what to do.

It is not the same when collective behaviors require mutually known expectations across all

agents (or, at least, a large group of participants). Traffic rules, use of language or signaling systems, dress codes, and meetings are classic examples of coordination problems. These multilateral expectations must match and be mutually known. Remember the conspiratory wink example above. Both the signaler and his compliance must know the same code and this understanding must be mutually acknowledged. Otherwise, the signal would be empty or misunderstood as a twitch. The same happens with traffic and signal rules, the epitome of coordination situations: everyone wants to coordinate with each other, since the consequences of failure may result in serious accidents.

Finally, *social norms* are the last collective behavior analyzed by Bicchieri (2017, p. 28, 2005, p. 8). Social norms are very similar to descriptive norms, but they have a crucial additional element: normative expectations. Individuals condition their preference upon expectations about how most people in their reference network act *and* expectations about how most people in their reference network believe they must conform to a particular action. Therefore, as we have seen above, the distinctive feature of social norms is this kind of "second-order expectation": the belief we have about other people's expectations about our behavior. Occupying a priority seat on a crowded bus without the proper requirements may attract many angry looks and verbal warnings from the bystanders. The anticipation of this unfortunate situation restrains our bad behavior.

Generally, social norms are enforced in contexts where individual actions negatively affect others or society, generating social dilemmas. Classic problems in game theory, such as prisoner's dilemma, the tragedy of the commons, and problems of collective action are extensively discussed in the literature and elucidate this point. Individuals face a conflict between collective rationality (the common good) and individual (egoistic) rationality. Therefore, social norms guarantee social cooperation and inhibit the temptations of transgression through sanctions and internalized negative emotions. According to

Bicchieri (2006, p. 26), social norms transform social dilemmas into situations of coordination, because they are a strong incentive for compliance with acceptable behaviors of common interest.

However, it is important to realize that social norms have a distinct dynamic from descriptive norms. Deviations in descriptive norms result in communication failures or risking one's life or the others. In situations where we have a descriptive norm in place, everyone will have a reason to conform to it because non-coordination has a high cost. Thus, descriptive norms are self-reinforcing. On the other hand, the transgression of social norms implies the application of sanctions, since they are linked to a system of shared values and emotions. To curb the consequences of generalized transgressions, individuals have an incentive to enforce social sanctions on deviants. Individuals may be punished with verbal warnings or even with more severe punishments, such as social ostracism, bad reputation, stigmatization, or physical aggression.

Notice that normative attitudes do not necessarily accompany normative expectations. This situation occurs when agents erroneously infer that conforming to a social norm is consistent with the belief that everybody believes that this rule ought to be followed. Nonetheless, for shame or fear, agents do not express their disapproval toward the social norm. This state of mind reaches each participant, who is trapped in a state of pluralistic ignorance. Although each participant of the reference network believes that their peers support that "this is what must be done," they secretly believe that only they disapprove it. There is a mutually collective mismatch between one personal normative attitude and the normative expectations of her reference network.

Despite their role in guaranteeing the common good of a society by means of a vocabulary of prosocial behavior, social norms also have a dark side. They can maintain and enforce oppressive practices. Female genital mutilation, child marriage, corruption, discrimination based on gender, race, or sexual orientation are social practices maintained through social norms. They are the expression of the prejudices and stereotypical images that a society or a group shares among its

members. This system of social oppression can lead to "social traps," in which oppressed individuals cannot modify the collective behavior unilaterally or deviate without punishment. In such cases, social pressure may impair participants' well-being and health behaviors (Cislaghi and Heise 2018; Edberg and Krieger 2020).

Understanding the structure and dynamics of certain collective behaviors is essential for effective interventions that seek social change. Thus, not all collective behaviors are equal or respond equally to the same incentives. Descriptive norms may change quickly with external interventions (like the enactment of a law or the spread of public information). A much-celebrated example is the change of hand in the Sweden traffic system in 1973. Drivers rapidly got used to driving on the right-hand side of the road, since all wanted to avoid accidents. However, laws may be ineffective against social norms. Anti-corruption laws, policies promoting health behaviors or laws prohibiting well-established social practices (such as child marriage or female genital mutilation) are examples that have been widely studied by governmental and international organizations. From these studies, we can learn at least three things: (1) to extinguish (or change) a specific social practice enforced by social norms, it is necessary to modify social values and expectations collectively; (2) even legal norms require social norms of legal obedience among citizens (otherwise, they will not be applied or recognized as legitimate); (3) to be effective, interventions must be anchored locally, taking an anthropological perspective of the agents and their cultural and social context (Mackie 2018; Bicchieri 2017, Chap. 3; Edberg and Krieger 2020).

## Social Responsibility and Business: The Milton Friedman Position

Deborah C. Poff  
Leading with Integrity, Ottawa, ON, Canada  
Brandon University, Ottawa, ON, Canada

## Synonyms

Corporate social responsibility critique; Social responsibility as anti-capitalist and anti-freedom

## Introduction

Milton Friedman (1912–2006) was primarily known for two well-known positions: one monetarism, as a leader of the Chicago school and as an anti-Keynesian critic and another position which is usually interpreted as his Political Philosophy. In this article, the focus is on the latter. In an article published in the *New York Times* in 1970 entitled, “*The Social Responsibility of Business is to Increase its Profits*,” Friedman (2005, 18) presented his theory about the purpose of business. In that article he argued that those who advocated for activities that engage executives in corporate social responsibility (CSR) on the part of those executives **qua executives** or on behalf of the corporations that employed them were “preaching pure and unadulterated socialism.” Further, business executives who advocated social responsibility or CSR were “unwitting puppets of the intellectual forces that have been undermining the basis of a free society for these past decades.”

## Overview

His arguments are basically as follows:

1. Corporations as artificial persons can only have artificial responsibilities but business cannot be held to have responsibility in any complex social manner or in any general sense.
2. Executives as employees of the business are responsible solely to be loyal agents of the owners (principals) of the businesses or its stockholders or shareholders.
3. The purpose of business is to make profit for the owners and stockholders or shareholders.
4. The principals to whom the executives are loyal agents want the executive to serve their interests which are solely to make as much money as possible as long as their interests are pursued in a manner consistent with law and local social norms.
5. If the executive makes choices that are not aimed at profit maximization, it is like taxation without representation because the executive was chosen to make money not give money

away for social ends. The executive should not choose to divert money for profits because stockholders or owners did not elect the executive to do so. By doing so, the executive starts taking on jobs that are in the domain of the government without being duly elected.

6. The executive is an expert at the business, not as an agent of socially responsible choices so may make the wrong social or moral choices.
7. The ends of socially responsible choices are uncertain and cannot be predicted with accuracy.
8. If executives decide to make choices that are not narrowly constructed and solely profit-oriented choices, they may start adopting socially responsible choices that negatively impact the business (e.g., choosing long-term unemployed workers as a good social aim rather than the best person for the job in terms of qualifications).

Further, as an underpinning assumption of Friedman's arguments is grounded in the Adam Smith theory of the Invisible Hand. In Smith's [2007 An Inquiry into the Nature and Causes of the Wealth of Nations](#) (Book IV, Chap. 11, paragraph IX), he famously wrote the following oft quoted passage:

As every individual, therefore, endeavors as much as he can, both to employ his capital in the support of domestic industry, and so to direct that industry that its produce maybe of the greatest value; every individual necessarily labors to render the annual revenue of the society as great as he can. He generally, indeed, neither intends to promote the public interest, nor knows how much he is promoting it. By preferring the support of domestic to that of foreign industry, he intends only his own security; and by directing that industry in such a manner as its produce may be of the greatest value, he intends only his own gain; and he is in this, as in many other cases, led by an invisible hand to promote an end which was no part of his intention. Nor is it always the worse for the society that it was no part of it. By pursuing his own interest, he frequently promotes that of the society more effectually than when he really intends to promote it. I have never known much good done by those who affected to trade for the public good. It is an affectation, indeed, not very common among merchants, and very few words need be employed in them from it.

There have been numerous critiques of Friedman's arguments over the years as well as of Smith's assumption concerning the invisible hand.

Many of the critiques of Friedman's article argue that all of Friedman's arguments are question-begging, that is, Friedman assumes what he is trying to prove. Other criticisms claim that there is overwhelming empirical evidence, counter-evidence to many of Friedman's assertions (e.g., that stockholders would always and only pursue profit-maximization as their single and only goal in business). Other criticisms attack the inadequacy of Friedman's arguments on moral grounds that have been previously tested. Michalos ([2005](#), 42–43) discusses the inadequacy of claiming to be a loyal agent pursuing the aims and goals of the principal (i.e., I was only following orders defense) which was found to fail the personal responsibility test for moral agency most notably during the Nuremberg trials, following World Wide II. Persons are not merely agents of principals but rather are moral agents who can and have been held to be individually responsible for participating in illegal and unethical actions on the part of corporations, government, and institutions. Other arguments are seen as just not reasonable to assume. For example, even if one assumes that executives do have the authority to pursue other than merely profit-driven goals as senior employees of companies, why would you assume that socially responsible choices would trump all business types of decisions in hiring and that an executive would consequently feel compelled to hire the hardened, long-term unemployed rather than qualified workers? Considering some socially responsible choices within business does not entail that these choices are always ultimate arbiters directing action, especially given that always choosing the seemingly most moral decision may result in the failure and consequent extinction of the company.

With respect to the belief in the so-called Invisible Hand, economists, such as Stiglitz ([2002](#)), have argued for many years that it is an implausible fiction.

So, why, if Friedman's article is so flawed, has it been the source of so many articles and critiques over the years? One reason may be because it served as an excellent foil for those who wished to make a case for the importance of businesses being socially responsible. For another, it was received by a community of consumers who were becoming concerned about and aware of the negative impact of companies that did not want to be concerned with the so-called externalities, such as air, water, and the general environment in calculating the cost of their business operations. In the economic climate of the 1970s and 1980s, it has also been argued that the article was well-received by corporate conservatives. As Denning (2013) put this perspective,

The success of the article was not because the arguments were powerful, but rather because people desperately *wanted* to believe. At the time, private sector firms were starting to feel the first pressures of global competition and executives were looking around for ways to increase their returns. The idea of focussing totally on making money, and forgetting about any concerns for employees, customers or society seemed like a promising avenue worth exploring, regardless of the argumentation.

The debate continues but suffice it to say, Friedman's article was not determinative for many concerned with the topic.

## Socially Responsible Investment and Corporate Engagement

Tessa Hebb

Carleton Centre for Community Innovation,  
Carleton University, Ottawa, ON, Canada

## Synonyms

Corporate engagement; Responsible investment; Shareholder rights; Socially responsible investment

## Definition

Responsible investment (RI) brings environmental, social, and governance factors (often referred to as ESG) into investment decision-making. Proponents of responsible investing suggest that over time taking these considerations into account can lower risk in an investment portfolio and may contribute to the financial performance of these investments. They believe companies that behave with certain environmental, social, or ethical standards maintain and even gain value over the long run (Clark et al. 2014). Given that institutional investors are increasingly long-term investors, we are now seeing responsible investing as part of mainstream finance. In fact, the UN-backed Principles for Responsible Investment with signatories managing over \$60 trillion of assets (PRI 2017) represents almost a third of the investable assets in the world and is a testament to the growing importance of responsible investment.

Responsible investment uses the legitimate rights of shareholders to influence company standards. It does not ask companies to sacrifice long-

term profitability. It seeks higher corporate standards in order to reduce risk over time. Though such corporate standards are often referred to as corporate social responsibility or CSR, it is important to note that responsible investment concerns itself solely with the long-term interests of shareholders. It aligns corporate managers with shareholders' long-term interests. CSR suggests that companies respect all their stakeholders including clients, employees, community, governments, suppliers, and customers as well as its shareholders. In contrast, many institutional investors argue that greater regard for the long-term and increased corporate social responsibility reduces risk, adds share value, and in the long run serves shareholders' interests (Dimson et al. 2015).

Socially responsible investing (SRI) adds an additional layer of consideration to investment decisions, that is, ethical considerations. Generally, we associate SRI with individual investment choice, as individuals are able to exercise their own ethical standards in their investment selection. Most institutional investors restrict themselves to ESG considerations. For these investors an ethical position must often become a societally accepted norm or code to warrant consideration. Avoidance of the production and use of land mines and cluster bombs, use of forced labor, and avoidance of conflict zones are examples of ethical considerations that have made their way into broad acceptance by both individual and institutional investors.

## Understanding Responsible Investment

Responsible investing stands in sharp contrast to the more traditional capital asset pricing model (CAPM) that is drawn from the efficient market hypothesis (EMH) where all available information on a company's stock is embedded in its current price. In the past, ESG factors were deemed nonfinancial and therefore were not taken into consideration. But a significant amount of research now points to the fact that companies with higher ESG standards improve their financial performance (on this point see Clark et al. (2014) for a meta-study of over 100 studies).

When investors own a company over a longer period of time, they face greater risk and uncertainty. No risk is hotter than the environmental risks companies are currently facing. With each of the last 3 years up to and including 2016 declared as the hottest years ever recorded globally, it is not surprising that investors are asking companies how they plan to manage climate change risk over time. The same is true for social risks such as exposure to conflict zones as in the Sudan or the reputation risk of unsafe and unfair labor practices in a company's supply chain.

When faced with company behavior deemed unacceptable by shareholders, investors have two decisions, either sell their shares and walk away from the investment or maintain their shares and engage with the company to raise its standards. Increasingly large institutional investors<sup>1</sup> are choosing to maintain their ownership of companies and engage with them in an effort to raise their environmental, social, and governance standards.

In the past many socially responsible investors chose to divest their holdings, often excluding whole sectors of the economy such as alcohol, gambling, nuclear, and weapons from their portfolios. More recently we have seen this approach advocated for fossil fuels. But while exclusion means the investor no longer owns the stock, it also means that the investor has lost his or her ability to influence the company and raise its standards. When one investor sells, another investor buys, and often the new investor is indifferent to the ESG or ethical standards of the firm. The second option is to maintain ownership of the stock and engage the company through a variety of mechanisms to raise their standards. Such corporate engagement is the preferred strategy for responsible and many socially responsible investors, and its influence has grown over time.

Corporate engagement is the term used to describe the use of legally defined corporate ownership rights by shareholders to raise the standards of firms. It can be active or passive, private or

<sup>1</sup> Institutional investors include investment funds (including mutual funds), insurance companies, pension funds, banks, and foundations.

public, reactive or proactive, and quiet or noisy. It can be used across all asset classes. Passive strategies include proxy voting, for example, while quiet strategies can be behind the scenes (private meetings and letters). Noisy and active corporate engagement strategies include placing minority shareholder resolutions at company annual meetings and developing public focus lists of poor performing companies. In general, corporate engagement is designed to leverage the power of shareholders within the corporate structure.

Several forces converged in the early 2000s that strengthened the ownership role of institutional investors. The first was the combination of increasing managerial excesses coupled with falling share values. Nowhere was this more evident than through the global financial crisis of 2008! Absentee owners were seen as part of the problem, with calls on shareholders to provide stronger influence on corporate governance and managerial oversight. In the widely held capital markets of today, such oversight is only possible when large institutional investors aggregate the authority of previously dispersed beneficial owners.

Institutional investors' newfound willingness to act in coalition was a second force at play in the early 2000s. In the past, the cost of corporate engagement when measured against possible gains meant that few minority shareholders were willing to monitor corporate management. Previously owners have been assumed to be widely dispersed and therefore essentially powerless in control of corporate managers and boards (Berle and Means 1933). But today's institutional investors hold such large stakes in individual firms, they are able to bear these costs alone and, more important, act in coalition with other institutional investors. As a result, corporate engagement has become a potent force in representing owners' interests in today's companies (Clark and Hebb 2005; Hebb 2008).

Such coalitions are possible because changes in securities laws allow for easier communication between shareholders and because transaction costs of both monitoring and coordinating responses have been lowered when measured against the increases in share value such activity generates. In the past pension funds, in particular,

were deemed ineffective as corporate monitors and were identified as "lone wolves" in their attempts to provide oversight of corporate decision-making. In the early 1990s, this tendency toward isolation was seen as the major drawback to institutional investors' effectiveness as corporate monitors (see, e.g., Coffee (1991, 1997) and O'Barr and Conley (1992) on this point).

There are, however, an increasing number of effective investor-led coalitions that provide models for corporate engagement. These new coalitions cluster around environmental, social, or governance issues of concern. The Principles for Responsible Investment addresses all three areas and provides a platform for collective action (Gond and Piani 2013). The Carbon Disclosure Project representing \$100 trillion in assets (as of March 2017), the Institutional Investors for Climate Risk, and CERES are three examples of effective coalitions working on environmental standards. Coalitions addressing factory conditions in Bangladesh demonstrate investor engagement focused on social issues. The Council of Institutional Investors and the International Corporate Governance Network are two long-established corporate governance coalitions. All of these investor-led coalitions have strong records of success in influencing companies to raise their standards. Most use some form of corporate engagement to achieve their goals.

## Drivers of Corporate Engagement

Four drivers propel institutional investors toward corporate engagement. In the 1980s and 1990s, most institutional investors behaved no differently from the rest of the financial market. These investors pushed companies to deliver a steady stream of quarterly earnings in order to meet standard industry benchmarks. But as institutional investors' assets grew, they lost their ability to simply sell stock when dissatisfied with performance (a practice known as the Wall Street Walk). Their sheer size means they hold large equity positions that make them increasingly vulnerable to the performance of the market as a whole. This phenomenon is known as the universal owner

(Hawley and Williams (2000, 2007) on this point). In OECD countries, pension funds, investment funds, and insurance companies have doubled since 2000 growing from \$36 trillion (US) to \$73 trillion by 2011 (Celik and Isaksson 2014).

In addition, during the 1990s many institutional investors began to use passive stock indices (such as the Standard and Poor's 500) for their equity investments. Over time it has become increasingly difficult for active money managers to "beat" the market as a whole, particularly once their fees are taken into consideration. The trend toward indexing grew during the 1990s and 2000s. In 1984, the 200 largest DB pension funds in the United States held only \$50 billion in passive index funds; by 2016 this amount had grown to almost \$800 billion (Kilroy 2017). As a result, they could no longer simply sell stock, as it was now part of a broader index in their portfolio. Paradoxically, the trend toward passive investment meant greater company engagement. As Bob Monks (1995) said, "If you can't sell, you have to care."

Corporate engagement's third driver is found in the growing evidence of financial value out-performance from ESG (Clark et al. 2014; Eccles et al. 2014). Increasingly institutional investors look to environmental, social, and governance indicators as proxies for long-term performance. Previously, measuring extra-financial corporate behavior was the domain of a few boutique-rating agencies. But interest in these aspects of corporate behavior is becoming increasingly mainstream with rating agencies such as Standard and Poor's, Bloomberg, and MSCI all establishing metrics by which to measure corporate governance, social, and/or environmental standards of firm behavior. Not only do institutional investors rely on rating agencies for analysis of the risks from these extra-financial indicators, they also use rating agency reports to indicate opportunities for corporate engagement.

The fourth driver of corporate engagement is the increasing amount of international equity held by institutional investors. For example, a recent Willis Towers Watson global pension fund survey (2017) found that in 1998 the funds surveyed held

31% of their assets outside their home country, and by 2016 this figure had almost doubled to 57%. With increased international exposure, institutional investors are becoming sensitive to the need for companies to conduct business in the framework of global standards. Equally dramatic is the increase in investment in emerging markets around the world where environmental, social, and governance risks are often greater than in more developed markets.

Given the growing power of international investment flows, it is little wonder that global activists see institutional investors such as pension funds as potential points of leverage to reach global equity and social justice goals. A new generation of international activists is drawing the world's attention to the deepening divide between developed and developing nations and, more explicitly, the growing gap between the world's wealthy and the world's poor. For many the goals of social justice, equality, human rights, labor rights, and environmental standards are seen to be pushed aside in the rush to serve the needs of global capital. However, there has been a growing realization that global capital flows can indeed become a useful tool if investment is harnessed to meet demands for sustainability and global social justice.

## Conclusion

Responsible and socially responsible investment have the ability to draw on enormous assets as leverage to raise the environmental, social, and governance (ESG) standards of the companies in which these funds invest. Long-term investment horizons mean that these investors are increasingly sensitive to the risk in their investment portfolio brought on by poor corporate behavior. But such activity is not driven by utopian views of capital markets but rather by enlightened self-interest on the part of these investors. By maintaining ownership in these companies and engaging them to raise their ESG standards, institutional investors can be a force for positive change around the world.

## Society for Business Ethics

Alex C. Michalos

University of Northern British Columbia, Ottawa, ON, Canada

## Synonyms

Business ethics organization; Organization for issues on social responsibility of business; Professional business ethics organization; Social responsibility of business organization

## Definition/Introduction

This is a brief description of the history of the Society for Business Ethics.

## Description

The Society for Business Ethics (sbe) is the first professional organization focused on business ethics or the social responsibility of business. It has a somewhat unclear origin but seems to have been nominally founded in 1991, and its first president was William Frederick. The president at this writing for 2016–2017 is Heather Elms.

The objectives of the sbe as specified on its website include promotion of “the study of business ethics,” providing “a forum in which moral, legal, empirical, and philosophical issues of business ethics may be openly discussed and analyzed,” publishing the journal *Business Ethics*

*Quarterly*, improving teaching of the subject, and developing “ethical business organizations.”

Celebrating its 25th anniversary in 2005, apparently assuming that 1990 was the appropriate starting point of the Society, Richard T. DeGeorge (2005), “as an early member and unofficial historian of the Society,” wrote and presented a brief history of the sbe at its annual general meeting. As he described it, “the business scandals of the day” in the early 1970s provoked him to publish “what was the first text in the area, *Ethics Free Enterprise and Public Policy*” (1978). The following year, three other anthologies appeared, Beauchamp and Bowie (1979), Donaldson and Werhane (1979), and Barry (1979). The “first single-authored books in the field appeared” in 1982 (DeGeorge 1982; Velasquez 1982). He neglected to notice that the most frequently cited scholarly journal in the world devoted to business ethics, the *Journal of Business Ethics*, also appeared in 1982.

Interestingly, while DeGeorge wrote that “the Society for Business Ethics appeared on the world scene in 1980,” his history does not include any information on its development from 1980 to its official establishment in 1991. However, the Society website provides some useful milestones sketching activities in the early years. It begins sometime in July 1978 with Tom Donaldson composing “the first known extant document of the society – a letter inviting Richard T. DeGeorge ‘to participate as a founding member in an organization for professional ethics or business ethics which is presently being developed’.” In December 1978, “a small number of philosophers meet at the Eastern Division of the American Philosophical Association annual general meeting” and propose a workshop on business ethics. In December 1979, the workshop takes place and “the group decides on the name ‘Society for Business Ethics’.” In January 1980, Donaldson “sends out letters inviting people to join the new Society and pay annual dues of \$5.00.” By April that year, “the Society had 185 paid members,” and in December, an executive group is defined with Donaldson as chair, Werhane as secretary-treasurer, and DeGeorge as “the third member.”

By July 1983, the Society has over 500 members. In September dues were raised to \$40.00, and “only about 100 of the Society’s more than 500 members pay on time.” Finally, for purposes of this entry, “in the January [1990] Newsletter the new President (now so-called routinely, despite the lack of any such office in the By-Laws) calls for volunteers for a committee to rethink the Society’s organizational structure.”

The sketch ends in 2005, but it provides anyone interested in the Society up to that point in time with quite a remarkable story.

Other professional organizations mentioned by DeGeorge include the European Business Ethics Network established in 1987; International Society for Business, Economics, and Ethics in 1992; the Japan Society for Business Ethics in 1993; the Latin American Business Ethics Network in 1997; the Business Ethics Network of Africa in 2000; and the Australian Business Ethics Network in 2010.

## Spirituality at the Workplace

David W. Miller<sup>1</sup> and Timothy Ewest<sup>2</sup>

<sup>1</sup>Princeton University Faith & Work Initiative,  
Princeton University, Princeton, NJ, USA

<sup>2</sup>Archie W. Dunham College of Business,  
Houston Baptist University, Houston, TX, USA

### Synonyms

Faith at work; Faith in the workplace; Religion in the workplace; Spirituality at work; Workplace spirituality

### Introduction

Spirituality in the workplace is a multi-dimensional concept, involving both spirituality and religion. Many refer to the phenomenon as Faith at Work, where the term faith encompasses conceptions of both religion and spirituality, as well as atheism and agnosticism, as they too, represent a *Weltanschauung*, i.e., a way of perceiving reality and filtering meaning and purpose. The words work and workplace typically refer to locations and activity involving paid work. Together, the faith at work or spirituality in the workplace phenomenon explores the individual, organizational, and social ramifications of integrating one's personal spiritual, religious, or faith *Weltanschauung* with one's work.

Religion and spirituality have extensive intellectual traditions, research, and resources within their respective disciplines of theology, religious studies, psychology, sociology, philosophy, ethics, and more recently, behavioral economics. Yet the consideration of the integration of religion and spirituality within the workplace, with the corresponding impact on individuals and organizations, has only recently been explored in the emerging field of research commonly regarded as spirituality in the workplace. This field considers how religion and spirituality contribute to individual and organizational identity, meaning, purpose, ethics, performance, well-being,

diversity, and development of interconnectedness and community. This field has developed its own growing body of literature, methodologies, and set of measurement which considers adherence, development, and manifestation of religion and spirituality in the workplace.

Finally, the workplace spirituality movement is not a geographically limited or religiously specific phenomenon. It can be found in people and societies shaped by religious and philosophical traditions, such as but not limited to Buddhism, Christianity, Confucianism, Hinduism, Islam, Judaism, and Sikhism. Both scholarly and practitioner interest in the faith at work movement can be found in both advanced and emerging economies. And as one might expect, in different countries and cultures, it has varying characteristics, accents, and manifestations.

### Definition

Spirituality has multiple definitions, but within the workplace context, it often references an individualized experience of transcendence through the work process, either of the self or one's relationship to God. The transcendence can focus on self-nurturance, meaning of work, involve greater care for others, a focus on important shared humane values, or a connectedness to others. Commonly held definitions of religion in the context of the workplace include work as a means of worshipping God, imitating God, serving others, discovering meaning and purpose in one's work, exercising one's God-given gifts, doing work ethically and excellently, and obeying God's commands to care for and be a steward of the wider community and environment.

### Description

For some, this desire to integrate their faith and work is a private and often subconscious activity. For others, there is greater intentionality and awareness of how their religious or spiritual tradition shapes and informs their decisions and actions at work. Shared by both religion and

spirituality is an embrace that one can and should be welcome to bring their whole self to work and not leave essential parts of their humanity and identity, including their faith, at home or in the parking lot. So vibrant and widespread is this interest by practitioners that scholars have deemed this spirituality at work phenomenon a bona fide social movement with a potential long-term impact on its actors and context, having as a common organizing principle the desire to integrate faith and work.

Religion and spirituality have extensive research within their respective disciplines of theology, religious studies, psychology, sociology, ethics, philosophy, and behavioral economics. Theologians and religious scholars have considered the importance of work for the life of the believer. Each of the major world religious traditions to some degree regard work as an important aspect of daily life imbuing it with sacred meaning, purpose, rights, and responsibilities. Many of the world's faith traditions have prescriptions or guidance regarding how tenants of faith are to be expressed or lived out in and through one's work. For example, Judaism stresses a commitment to honest and ethical behavior in business dealings and also a commitment to help heal or repair the world (*Tikkun olam*). Catholicism has ancient and modern accents, ranging from Saint Benedict's sixth-century motto of *Ora et Labora* (pray and work), which sought to integrate and balance prayer and work in monastic communities, to several modern papal encyclicals that guide laity in their work, stressing, not only the dignity of work and worker, but also a spirituality of work, based on a sense of co-operation to the Creation and working in union with Jesus Christ and the importance of faith, hope, and charity in human work and in economic matters. Protestantism naturally draws on Jewish and Catholic work-related teachings, but also accents how work itself can be a divine calling, to be done honestly, excellently, as if working for God; it also stresses the theme of stewardship, recognizing that God is owner of all and humanity is charged to be trustees or stewards. Islamic teachings seek to guide all domains of economic life, such as forbidding the charging of interest (*Riba*), while also accenting the theme

of stewardship (*Khalifa*). Non-Abrahamic traditions also guide practices and attitudes toward work, such as Hinduism that prescribes the type of work based on who a person is (*Purusha*) and working in accordance with universal order (*Dharma*).

William James, in 1902, offered a psychological synopsis of different religious experiences and their impact on engaging life, including work in his classic study, *Varieties of Religious Experiences*. About the same time, Max Weber, one of the first to employ novel sociological techniques, considered how Protestant beliefs impacted workplace practices in his iconic study, *The Protestant Ethic and the Spirit of Capitalism*. And modern economists, such as Nobel Laureate, Robert William Fogel (*The Fourth Great Awakening and the Future of Egalitarianism*), and Robert Nelson (*Economics as Religion: From Samuelson to Chicago and Beyond*), reflect on the role of religion and spirituality in economics.

The field of Spirituality at the Workplace acknowledges but moves beyond identifying spiritual and religious prescriptions. It also considers personal and organizational strategies for integration and the corresponding impact religion and faith have on the workplace. This field has emerged due to multiple forces which include an increased awareness of individual religious rights and accommodations, increasing global religious diversity in the workforce, and economic changes which have both harmed and benefited workers in varying ways, causing new and lost opportunities, inspiration and demoralization, and hope and despair. And even for those fortunate to have employment, they find themselves technologically tethered to their work even when at home or leisure. This often causes employees to seek deeper meaning for their lives and community from work and correspondingly from society.

## Spirituality Dimensions

The integration of faith and spirituality can be seen at the individual, organizational, and societal levels. Individually, workers are expecting employers to respect and in some cases, embrace

or enhance their personal spiritual and faith practices. This involves going beyond religious accommodation requests (e.g., prayer, attire) to facilitate religious expression (e.g., Google provision of meditation space or Tyson Food's multi-faith chaplaincy program). Organizationally, some companies now consider the faith and spirituality of the employees as part of their commitment to well-being and diversity and inclusion programs. They institutionalize workplace policies to respect faith traditions, including such things as religious holidays, attire, prayer practices, and dietary considerations. Some of this is driven by a desire to treat employees holistically, and some is driven by utilitarian self-interest. Increasingly, organizations see potential bottom-line benefit in matters of attraction and retention of talent, organizational citizenship, and avoidance of legal risk associated with violating employees' religious rights (e.g., Title VII in the United States). And the potential impact on society, while more abstract, might steer corporate behavior towards questions of social responsibility, ethics, environmental stewardship, and sustainability. Moreover, the individual, organizational, and societal levels of interest in spirituality and religion will only increase with continued employee diversity and pluralization, driven in part by globalization, immigration patterns, and legal rulings.

This field also considers how spirituality and religion contribute to individual and organizational identity and meaning. Individuals use work as a vehicle to demonstrate their religious identity and/or as a means to foster inner altruistic others-centered values. Research has determined a person who identifies with religious or spiritual orientations prioritize their personal identities and their spiritual and religious identities being among them. The significance of their inner spiritual or religious identity is valued because it enables a deep sense of meaning for their work. This intrinsic connection to work, especially regarding an individual's faith, has been identified as a sociological phenomenon. This emerging field also considers how religion and spirituality impact the performance and related ethics of individuals and organizations that embrace or are inhibited in

expressing or developing religion or spirituality in the workplace.

Specifically, those organizations that accommodate or welcome an employee's faith or spiritual practices do so both to respect the individual and enhance the employees work-life balance, but may also do so to enhance organizational commitments from the employee towards the organizations, empowering them to engage more fully in their work, increasing performance, and fostering job satisfaction. Organizational support of individual religious and spiritual expression also emboldens employees' ethical commitments, since ethical commitments are often motivated or strengthened by the person's spiritual or religious traditions and teachings.

Some of the researchers in the field regarded religion as being pejorative and spirituality as being positive. Yet sociologists and scholars of religion would generally agree that such judgments demonstrate a shallow understanding of both religion and spirituality, often setting up a false dichotomy between different modalities of belief systems and practices. Scholars from many disciplines recognize that both spirituality and religious traditions often positively shape and inform the aforementioned individual and organizational/societal views of ethics, moral reasoning, fairness and justice, and well-being. And more recently, both religion and spirituality research has indicated that religion and spirituality have positive impacts on ethics, leadership, citizenship, organizational outputs, and work life balance.

Diversity and human rights are also considered within this field of research, considering both the positive and negative impacts of religion in the workplace. The positive impacts of religious integration are focused on increased organizational commitment, and the negative impacts typically pertain to religious harassment or discrimination claims, commonly regarding accommodation requests for issues pertaining to garb, time for prayer or religious holiday observance, dietary needs, or restrictions on permitted job activities. This tension in the workplace occurs as religious and spiritual expression is also regarded as a universal human right and in many cases is protected (or restricted) by national laws. A proposed

solution is for individuals and organizations to practice respectful pluralism, which seeks to find shared values and common ground while also acknowledging and respecting differences in beliefs and practices.

## Measurements

Following social scientific research practices, in recent years researchers have sought to develop scales to better analyze the impacts and expression of spirituality and religion in the workplace. While there are numerous scales which measure spirituality and religiosity more generally, or more specifically for medical, psychology, or ecclesial purposes, fewer scales have been designed to consider the impact, existence, expression, or development of religion or spirituality in the workplace. These scales and measurements generally fall into three categories: adherence, development, and manifestation of religiosity and spirituality. Instruments that measure adherence consider the degree to which religion is manifested and believed by an individual are regarded as religiosity. Instruments that measure development consider the growth of an individual from nascent to mature belief. Finally, scales that measure manifestation consider how a religious or spiritually oriented person manifests or expresses their faith or spiritual identity.

## Managing Workplace Spirituality

With the rise in employee interest in bringing their whole self to work, including their spirituality, companies can no longer ignore this subject or view it as taboo. There are different organizational attitudes towards this field of Spirituality in the Workplace. One framework refers to them as faith-avoiding, faith-safe, faith-based, and faith-friendly. As the names of the categories suggest, some companies think spirituality at work is overwhelmingly problematic and should be avoided; others will accommodate requests but not proactively embrace it; some, usually privately held companies, will base their identity and core values on a particular religious

tradition, and finally, there is increasing interest by large publicly traded corporations in the faith-friendly model that not only accommodates but also embraces the individual and organizational value of spirituality in the workplace, with an inclusive attitude that respects all traditions while privileging none.

This field has application to the practice of management in the workplace, whether the individual manager's own personal attitude toward spirituality and religion or how the manager considers that of their employees. Applications of the field of faith and work to the workplace to the practice of management also consider the importance of personal ethical probity as well as wider organizational behavior, diversity in how people express various beliefs or practices, experience their work to have meaning and purpose, and the personal enrichment and growth that spiritual practices bring employees. Spirituality, when applied to the practice of management, emphasizes humane treatment of people, respect for the environment, building communities with common bonds and values around a higher purpose and mission, and fostering intrinsic motivation. Finally, the practice of "presence" (or awareness or consciousness) is also a common application and focus of spirituality to management and human relations policies.

## Summary

Spirituality in the workplace is a multidimensional concept, involving both spirituality and religion, with extensive historical research within their respective disciplines of theology, psychology, ethics, sociology, philosophy, and behavioral economics. There is a historical and more contemporary body of scholarship considering the integration of religion and spirituality within the workplace and their corresponding impacts. This research considers how religion and spirituality contribute to individual and organizational identity, meaning, ethics, performance, well-being, and diversity. Finally, this field has developed its own set of measurement which considers adherence, development and manifestation of religiosity and spirituality in the workplace.

## Spirituality Versus Unethical Business Practices

Carole L. Jurkiewicz  
School of Public Affairs, University of Colorado  
Colorado Springs, Colorado Springs, CO, USA

## Synonyms

Ethics; Loyalty; Transcendence; Value Congruence; Values; Workplace spirituality

## Introduction

Workplace spirituality is a configuration of values operationalized in the workplace that facilitates the feeling of individual transcendence through one’s work. Feeling that one’s daily efforts have a meaning beyond the mere production of products or services connects the individual to others, offers a sense of contributing to a larger cause beyond profit, and elevates one’s personal sense of value and purpose. It has no connection to any religion or existential dogma but is rather a strategic tool that offers benefits to the organization and the employee.

## Workplace Spirituality

Workplace spirituality, a term often misunderstood and assumed to advocate religious practice in organizations, is wholly separate from any theology or lack thereof. Religion in the workplace is

divisive as it exercises an inherent bias against individuals whose beliefs differ from whatever religion is advocated, as well as those who are agnostic or atheist; in many cases it is also illegal. Spirituality in the workplace does not require a belief in a power beyond humanity nor adherence to a sacred dogma (Giacalone and Jurkiewicz 2010). Even those employees who do not self-identify as spiritual prefer to work in organizations that exhibit workplace spirituality characteristics.

Workplace spirituality entails the translation of values into organizational practices such as opportunities for employee development and growth, sharing of information and resources, truthfulness, openness, forums for employees to connect beyond goal attainment, and discussions of the purpose of one's individual work and how it fits within the larger picture of the business' operations. As many countries' residents become increasingly mobile and family structure is likely to become separated both within the home country as well as across countries and continents, individuals increasingly rely upon the workplace structure to provide that sense of connectedness essential for human psychological health. Additionally, organizations exhibiting workplace spirituality are supportive of their employees, welcome divergent opinions increasing the sense of individual belongingness, and provide adequate and fair compensation that demonstrates respect for the employee and their unique value; they encourage calculated risks supporting the growth of the individual employee, demonstrate respect for employees' health and quality of life through their policies and practices, engage in effective conflict resolution to ensure a sense of cohesiveness and group identity, and have appropriate degrees of participative decision-making (Kolodinsky et al. 2008). Additionally, they are considerate of the environment and community in which they operate and display regard for their clients and vendors through fair and equitable business practices.

The benefits of workplace spirituality to the organization and its employees are many. There is a strong person-organization fit that flows from the existence of workplace spirituality, and such

value congruence leads to higher levels of intrinsic motivation. Employees are healthier (both physically and psychologically), more loyal, experience higher levels of job satisfaction, and more closely identify with the organization. Employees make better decisions and are more engaged in attaining the goals of the organization; achieving organizational goals effectively is internalized as a personal objective, and employees take pride in meeting the expectations of their employers. Employees' self-esteem and self-image are connected to their positive participation in their jobs, and they tend to psychologically identify with the company – both conditions that contribute to enhanced creativity and motivation. Employees report high levels of psychological rewards and less frustration and stress, which spills over into and amplifies their personal life satisfaction (Kolodinsky et al. 2008). Further, organizations that practice workplace spirituality are also more profitable.

## Unethical Business Practices

Unethical business practices, alternatively, damage reputations, harm careers, deter potentially valuable employees from seeking a position there, negatively impact earnings in the long term, and can lead to litigation and potential bankruptcy. Employees subject to unethical business practices have reduced motivation, can feel dehumanized and under-appreciated, suffer from negative psychological and physical health effects, experience high levels of stress, and are more prone to engage in workplace violence and theft. They are often disloyal in response to the unethically, more likely to sabotage the organization's efforts, more likely to steal from the organization, and are less loyal; the more valuable employees are prone to leaving the organization, discourage others from working at the location, and seek employment elsewhere. Further, they experience a higher level of substance abuse which leads to forced errors and absenteeism and are less likely to get adequate exercise and eat healthily. They experience depression and suicide, poor personal relationships, and increased

violence; they also suffer from post-traumatic stress disorder and have shortened life spans (Promislo et al. 2012). The list of negative consequences continues, and none result in positive outcomes for the employee, his/her family, or the organization.

There are three categories of organizational indicators that underscore unethical business performance: structure, culture, and leadership (Jurkiewicz 2013). Structurally, the elements most often associated with unethical business practice are a strict vertical hierarchy with authoritative reporting relationships, lack of interdepartmental communication and cooperation leading to increased dysfunction and conflict, unclear job descriptions and performance expectations, lack of accountability mechanisms, and a geographical location with lower levels of resident education. Negative cultural indicators include a high incidence of groupthink and a discouragement of voicing contrary opinions that are important for an organization's creativity and effective problem-solving; an unclear and unarticulated reward system leading to aberrant and unhealthy task confusion; strong pressures toward short-term goal attainment at all costs, including harm to the organization and employees; and a disparity between the stated organizational values and how leaders actually operate within the system. On the leadership dimension, characteristics correlated with unethical performance involve leveraging organizational authority for personal gain; fostering in-groups and out-groups among employees which fuels conflict and prevents effective collaboration; unequal disciplining of undesirable employee behaviors; and blaming others for their mistakes.

## Conclusion

The implementation of workplace spirituality has significant long-term benefits to the organization, its employees, the community, and the stakeholders/shareholders. It is a strategic cultural tool for effective organizational performance and job satisfaction. Unethical business practices, on the other hand, are associated with negative organizational and employee outcomes, ranging from

increased stress to suicides and bankruptcy. Both approaches to organizational management center on a set of operational values, both explicit and implicit, which constitute the culture of the organization. Deloitte, Wegmans Food Markets, and Capital One Finance are three examples of companies that embody many of the qualities of workplace spirituality. As a counterpoint, Xerox, DISH satellite television and internet provider, and Family Dollar are three examples of companies that rank low on workplace spirituality (Lallitto 2017). The companies with the reportedly most unethical business practices (Hunt 2018) include Amazon, Walmart, and Coca-Cola.

## SRI's Normative and Ethics-Based Rationales

Benjamin J. Richardson

Professor of Environmental Law Faculty of Law,  
University of Tasmania, Hobart, TAS, Australia

### Synonyms

Ethical investment; Fiduciary; Influence; Law;  
Social licence

### Introduction

Socially responsible investment (SRI) has a long lineage. Faith-based investors practised it for centuries to ensure they did not invest in “sin.” In recent decades other types of investors have embraced it, challenging apartheid, tobacco, and fossil fuel industries. The SRI sector has grown dramatically, and with this growth its rationales have changed. While some investors embrace SRI as a matter of ethical compulsion, many act for other reasons including their financial self-interest. Some may even no longer speak of SRI or “ethical investment,” but instead refer to “environmental, social and governance” (ESG) issues as “financially material” (Ransome and Sampford 2011). This article evaluates the principal rationales for SRI, namely legal compliance, to avoid complicity in undesirable activities, to use leverage to enable positive change, and to accrue financial advantages.

### Legal Compliance

Social behaviour is often shaped by legal norms, and SRI is no exception (Richardson 2012). The legal responsibility of investors to consider ESG issues is primarily a matter of interpretation of existing fiduciary and trust law standards (in common law jurisdictions), and to a lesser extent legislative prescription. Advice commissioned by the United Nations Environment Programme's Finance Initiative (UNEP-FI) concluded that

consideration of ESG issues is “clearly permissible and is arguably required in all jurisdictions” (Freshfields Bruckhaus Deringer 2005, p. 13).

While individuals can freely invest in accordance with their moral scruples, legal restrictions apply when a financial agent acts on another's behalf. Fiduciary law obliges the trustee to act loyally towards the beneficiary (e.g., pension fund members) without any conflict-of-interest or bias. The trustees of a philanthropic fund such as a university endowment, without beneficiaries, owe this duty to the organization's mission. Affiliated trust law posits standards of care to invest with skill and diligence, as typically shown by a diversified investment portfolio. Banks do not generally owe such responsibilities to their clients, whether depositors or borrowers.

Fiduciary and trusts law may allow, and sometimes oblige, SRI in several contexts. First, the duty to promote beneficiaries' “best interests” may include investing for social and environmental gains if these dovetail with their best interests. Even if their interests are couched narrowly in financial metrics, ESG issues may still be considered where ESG issues affect investment performance (Sullivan et al. 2015, p. 9). Nonetheless, these conclusions do not necessarily dictate any specific *form* of SRI: taking into account climate change might involve divesting from fossil fuel companies or using shareholder rights to exert influence. Second, SRI may be allowed where rival investment options offer comparable financial rewards, in which case the “more ethical” option can be the “tie breaker.” Financial research suggests that SRI sometimes matches conventional investments (Orlitzky et al. 2003), although it is difficult to apply the “tie breaker” given that investments are typically managed holistically within a single portfolio of many financial assets where comparisons between two options are hard to determine. Third, the trust deed or equivalent constitutive instrument, such as a mutual fund prospectus, may allow or require SRI, and many mutual funds now sell boutique portfolios to ethical investors. Fourth, the law may allow financial managers to practice SRI if their beneficiaries consent, which could be given through consultation procedures or beneficiaries voicing their

opinion through nominated representatives (if any) on a board of trustees. But rarely in any large fund would beneficiaries be of one mind, and because of the fiduciary duty of impartiality, trustees cannot make investment decisions that prefer the view of one group of beneficiaries over another.

Only rarely does legislation explicitly authorize SRI practices. The United States' Sudan Accountability and Divestment Act 2007 allows financial managers to divest from Sudanese oil, minerals, and other prescribed sectors, without risk of financial liability, so long as they publicly disclose their position. The Ontario South African Investment Act (now repealed) authorized trustees to divest from any South African investment, provided that a majority of the fund's beneficiaries did not object. In 2015 California enacted the Investing with Values and Responsibility Act, which obliges the state's largest public pension plans to remove all holdings in companies that earn at least half of their revenue from coal mining.

## Complicity and Social Licence

In addition to their legal licence, many companies and other economic actors need a social licence to operate, and it provides another normative rationale for SRI. Social licence means the tacit permission that communities may give an entity to engage in an activity, such as mining, based on the perceived impacts and benefits of the industry (Yates and Horvath 2013). An enterprise's social endorsement can motivate it to improve its social and environmental performance even though its legal licence remains unchanged. The discrepancy between the social and legal licence may arise because of new environmental information, shifts in social values, or the behaviour of the company itself. A firm losing a social licence risks community protests, customer and investor boycotts, or alienation of suppliers and employees.

Unlike typical challenges to a social licence that directly target the offending business activity, such as factory farms or sweatshops, financial investors in such an activity can also be tainted. Investors in problematic industries such as tobacco or fossil fuels may lose their social licence because

they are *complicit* in the associated social or environmental harms. Most investors speak of "reputational risk" to describe this risk to themselves.

"Complicity" is a long-standing concept of moral accountability, encompassing abusive conduct where one party causes harm with the knowledge or support of another (Moore 2010). Infamous examples include Swiss bankers handling Nazi gold and weapons producers selling to corrupt dictators. Faith-based investors such as the Quakers who pioneered ethical investing centuries before it became mainstream relied on complicity as the moral touchstone for their practices (Ransome and Sampford 2011, pp. 57–62). Today, complicity informs the SRI policy of the Norwegian Government Pension Fund-Global (NGPF-G), the world's largest SRI investor (Nystuen et al. 2011). It excludes companies that produce dangerous wares such as land mines, as well as companies engaged in activities with harmful sequelae such as severe environmental damage.

Complicity is not easily identified because of social disagreement on the level of facilitation, knowledge, or benefit to trigger blame. As Kutz (2011, p. 74) explains, "given the complex intertwining of capital in a globalized world, it is inevitable that any investment decision would link one to wrongdoing in some form." Furthermore, complicity has a negative orientation, focusing on *avoiding* association with specific actors who perpetrate harm rather than encouraging investment that supports good behaviour. Complicity may also set the threshold for SRI actions such as divestment too high, but much harm such as greenhouse gas emissions accrue incrementally which, in isolation, might seem trivial.

## Leveraging Positive Change

For some social investors, the goal is not simply to avoid sin but to ensure less sin. They see their moral duty as to leverage positive change, an approach that has been an important dimension of corporate social responsibility and moral philosophy. Leverage-based responsibility means "in some circumstances [an entity] has a responsibility to exercise its leverage over actors with whom

it has relationships in an effort to improve that state of affairs” (Wood 2011, p. 13). It thus links morality to investors doing good. It was a powerful argument for the South African divestment campaign, behoving investors to use their power to help topple the racist regime (Dembinski et al. 2003), and since then leverage-based responsibility has figured in divestment campaigns against the tobacco industry and fossil fuels.

The moral responsibility to exercise leverage requires that the actor have some capacity to wield influence, either alone or in combination with others. This usually requires a material connection, such as investors affecting the behaviour of companies by withholding or providing finance, or engaging with companies through shareholder activism. Such a material connection may be hard to discern as investors participate in financial markets through many chains of intermediaries, and even the very largest actors, sovereign wealth funds like the NGPF-G, typically own only a tiny fraction of the shares of any individual company. A more concrete connection exists where a bank lends for a major development project such as a coal mine or oil refinery. Besides such bilateral ties, leverage-based responsibility might flow from a more diffuse web of relationships; an investor might be judged by its peers and wider society on whether it has issued press releases to shape public opinion or lobbied authorities for better regulation. This wider view of leverage dovetails with the “sphere-of-influence” theory, as acknowledged in the preamble of the United Nations’ Global Compact of 2000 and draft Norms on the Responsibilities of Transnational Corporations of 2003. However, it wasn’t embraced by John Ruggie, Special Representative of the UN Secretary-General for business and human rights, who believed the theory represents “a useful metaphor for companies in thinking about their human rights impacts” but “a more rigorous approach is required to define the specific parameters of [their] responsibility” (Ruggie 2008, p. 19).

The actual influence of social investors on corporate social and environmental behaviour has not been closely researched and remains quite speculative. Corporate finance theory predicts that such influence is limited if the selling pressure on

targeted companies lacks an underlying business case (Loderer et al. 1991). In such circumstances, the company’s share price may remain unaffected. But markets can function unlike textbook models for a host of reasons including actors’ imperfect information and market regulations, which may give social investors opportunities to influence share price especially if the company is particularly unique (i.e., there has been few substitutes for investors) or trades in small, restrictive markets (Rivoli 2003). While companies can also borrow money, banks can be even more influential for clients seeking large project loans. Banks’ influence over clients extends to holding loan security, supervising compliance with loan conditions, selling insurance and giving general business advice – all situations where banks may consider social and environmental issues in their due diligence. One example of lender influence was the decision of an Australian bank to deny a A\$1.5 billion loan sought for a giant pulp mill in Tasmania, a decision that killed off the pulp mill and ultimately its proponent, the forestry company Gunns. Its shares were also subjected to selling pressure by antipulp mill proponents, which had a measurable impact (Lewis et al. 2015). On the South African boycott, studies found divestment announcements had a modest, short-term negative effect on stock returns for some corporations (eg Meznar et al. 1998). University of Oxford researchers who developed a theoretical framework to predict the effects of fossil fuels divestment concluded that its direct effects are minor and short-term, such as on share price and borrowing costs (Ansar et al. 2013).

Finally, in gauging the utility of leverage-based responsibility, some social investors believe they can wield more influence by staying with companies rather than selling out. Retaining shares can allow investors to exercise leverage through shareholder rights such as filing resolutions and informal dialogue with corporate management. Indeed, engagement has become the dominant method of SRI generally, as it not only allows for a diversified portfolio – as aligned with fiduciary responsibility – but the activity of engagement itself demonstrates fiduciary stewardship.

## Financial Motivations

Although SRI was once known as “ethical investment,” today its principal *raison d’être* is financial advantages to investors. The advantages coming from greater due diligence on the financial risks and opportunities associated with corporate social and environmental performance. Business tabloids increasingly proclaim the profitability of the green sector, such as renewable electricity generation (Neslen 2016), while specialist SRI funds that target green businesses have won praise for their financial benefits (Watson 2016). Conversely, social investors seek to avoid the financial downside such as industry sectors affected by more stringent environmental regulations (e.g., carbon taxes). In the case of fossil fuel industries, the downside is sometimes characterized by the “stranded assets” metaphor – namely, that oil refineries and coalmines will eventually become economic dinosaurs.

With increasing emphasis on SRI's business case in order to attract mainstream investors such as pension plans and insurance companies, researchers have sought to quantify the financial merits of SRI. Research generally suggests that SRI offers comparable or superior risk-adjusted financial returns relative to conventional investments (Orlitzky et al. 2003). Nonetheless, the survey methodologies can be faulted for their inconsistent definitions of “socially responsible,” and some research makes contrary findings (Copp et al. 2011). Corporate finance dogma predicts that SRI will financially underperform the market if it leads to less diversified portfolios given that modern portfolio theory holds that a diversified investment universe produces optimal returns (Rudd 1981). On fossil fuels specifically, Fischel (2015) found that over the past 50 years since 1965 a divested portfolio would have yielded a 23% lower return on investment.

While the business case for SRI has become the dominant incentive for most investors, SRI has not yet achieved widespread market influence because many fund managers still see

environmental and social issues such as climate change or human rights as too nebulous for financial quantification (Solomon 2009, pp. 21–23). Investment professionals accustomed to cues such as sales growth, return-on-equity, and price/earnings ratios may ignore ESG issues except when quantifiable, such as a pollution liability sanction imposed by a court. Furthermore, the financial materiality of ESG may not accrue except over the long term, even several decades, beyond the periods by which investors typically measure performance such as quarterly financial reports (Richardson 2008, pp. 120–158).

In sum, SRI spans a diversity of normative rationales, ranging from ethical compulsion to financial advantage. No single rationale offers a complete explanation for the motivations of all social investors, and in practice SRI in any context likely reflects the influence of several interwoven rationales.

## Introduction

The topic of trustworthy artificial intelligence (AI) has attracted wide attention from governments, companies, and international bodies as they strive to address the ethical and societal risks that emerge as performance of data-driven machine learning scales and improves at pace. Rapid and disruptive advances are evident across a range of applications including digital content search and selection; business data analysis and decision-making; natural language understanding, generation, and translation; and speech and video processing. Concerns include the disruption caused by automation of tasks previously requiring human intelligence and communication skills, the ability to produce previously unattainable insights from integrating large data streams monitoring human behavior, and the dangers of automated decisions persisting or magnifying socially unwanted biases. These concerns are exacerbated by the opaque nature of modern deep learning systems that renders their internal decision-making unintelligible even to practitioners and poses significant challenges in attempts to provide clear human-understandable explanations of AI decisions. Well-publicized episodes have already highlighted existing problematic applications of AI and eroded public trust. These include the profiled individual targeting of online content and advertising, decision

recommendations in the criminal justice system, performance drift in medical diagnosis, and safety critical automobile and airplane management. The ethical and societal implications of these episodes have amplified the call for common international approaches to the development, operation, and governance of trustworthy AI systems.

The explosion of interest in trustworthy and ethical AI was heralded by the publication of the Asilomar AI Principles resulting from an assembly of academic and industry actors organized by the Future of Life Institute at the Asilomar Conference Grounds in California in 2017. At the time of writing in autumn 2020, an online tracker of AI initiatives provided by the Council of Europe counts over 350 different initiatives, dominated by national authorities, international organizations, and the private sector.

To date, influential international contributions include the following:

- The report on Ethically Aligned Design (EAD [2019](#)) from the Global Initiative on Ethics of Autonomous and Intelligent Systems of the Institute of Electrical and Electronics Engineers (IEEE), which presents a wide-ranging international expert review to provide a set of principles for such design, as well as discusses the influence of classical ethics and professional ethics and the role of different moral worldviews or value systems such as Western ethics, Buddhism, Ubuntu, and Shinto
- The European Commission's High-Level Expert Group's Ethics Guidelines on Trustworthy AI (HLEG [2019](#)), which is informing the EU's declared drive to become a center for trustworthy AI development and to legislate on the topic
- The OECD Council on AI's Recommendations (OECD [2019](#)), which were adopted by the OECD Council of Ministers on 22 May 2019 as the basis for further collaboration on AI policy
- HLEG's ([2020](#)) Assessment List for Trustworthy Artificial Intelligence (ALTAI) which develops principles of HLEG ([2019](#)) into a checklist for self-assessment by practitioners

To date however, most similar proposals offering guidance on trustworthy AI and its ethical dimensions have focused on defining overriding principles that organizations, governments, or societies may apply to the problem or reflective questions to aid deliberation with organizations. Jobin et al. ([2019](#)) identify that there is an apparent consensus on the importance of ethical principles of transparency, justice, non-maleficence, responsibility, and privacy across 84 such policy documents, whereas other common principles of sustainability, dignity, and solidarity in relation to labor impact and distribution garner far less attention. Other smaller analyses have also identified gaps in ethical reasoning. One example is the Access Now ([2018](#)) program which analyses and identifies a lack of attention by national authorities to the use of AI by governments and in weapon systems. In addition, Hagendorff ([2019](#)) notes a general focus on individual rather than collective harms such as loss of social cohesion and harm to democratic systems. Among private sector proposals, Wagner ([2018](#)) notes a tendency to diminish the need for government regulation, while Calo ([2017](#)) warns that ethical principles may present barriers to market entrants. Furthermore, Whittlestone et al. ([2019](#)) note the lack of analysis of the tensions between stated ethical principles and commercial imperatives.

## Trustworthy AI Standard Development

Given these natural differences, continued work on normalizing principles internationally may not serve to advance international consensus in a practical way. Instead, many organizations and governments are shifting focus from the identification of principles to the means for turning those principles into practice. As with the development of trustworthy and ethical AI principles, approaches to related practice are also very diverse and often reflect the capabilities and positions in power structures of those considering specific approaches. Understanding existing standardized information and communications technology (ICT) development and organizational management practices offers insight into the

extent to which they may provide a basis for standardizing practice in governing the development and use of trustworthy AI.

Standards developing organizations (SDOs) are themselves very diverse and vary in their attitude to addressing specific ethical issues. The IEEE's Global Initiative on Ethics of Autonomous and Intelligent Systems has spawned the IEEE 7000 Standards Working Group that places ethical issues at its heart (Adamson et al. 2019). The working group is already addressing ethically aligned standards including ethical design processes; transparency for autonomous systems; algorithmic bias; children, student, and employee data governance; AI impact on human well-being; and trustworthiness rating for news sources. Data governance, of a series of standards development activities.

A different approach is taken by the ISO/IEC Joint Technical Committee 1 (JTC1) which was established by the International Standards Organization (ISO) and the International Electrotechnical Commission (IEC) in 1987 to develop, maintain, and promote standards in the fields of information technology (IT) and information and communications technology (ICT). Expert contributions are made via national standards bodies, and documents (over 3000 to date) are often used as technical interoperability and process guideline standards in national policies and international treaties, as well as being widely adopted by companies worldwide. Statements of relevance to UN Sustainable Development Goals (SDGs) and Social Responsibility Guidelines are an inherent part of all new standardization projects proposed in JTC1. AI standards are addressed together with big data technology standards by the JTC1 subcommittee (SC) 42 which was formed in 2017 and first met in spring 2018. In common with other JTC1 standardization activities, this places a strong emphasis on ensuring consistency with existing process and interoperability standards as well as reuse of existing terms and concepts to provide industry with a consistent body of applicable standards. JTC1/SC 42 is therefore addressing AI-related gaps within existing standards for management systems, risk management,

governance of IT in organizations, IT systems and software quality, etc.

## Characteristics of Trustworthy AI

JTC1/SC 42 has developed a technical report that sets out some of the core concepts and issues for standardization related to trustworthy AI (ISO/IEC 24028:2020). Trustworthiness is defined as the ability to meet stakeholders' expectations in a verifiable way. When applied to AI, trustworthiness can be attributed to services, products, technology, data, and information as well as organizations when considering their governance and management. Characteristics we might expect a trustworthy entity to exhibit could be related to technical characteristics such as reliability, robustness, verifiability, availability, resilience, and quality; bias and robustness; stakeholder-related ones such as ethics, fairness, and privacy; and management- and governance-related characteristics such as transparency, explainability, accountability, and certification.

The remainder of this chapter considers the prospect for international standards development related to these different characteristics of trustworthy AI.

## Technical-Related Characteristics

A wide range of technical characteristics relate to trustworthiness; however, these can to some extent build on existing standards related to software development, testing, quality, and safety. The specific technical characteristics of modern AI such as machine learning, deep learning, and neural networks raise novel technical concerns that are being addressed in new standards. These forms of AI are developed through assembling a dataset related to a problem domain that is used to train a model that can exhibit effective and reliable behavior when presented with similar data in an application. This therefore raises the need to test both datasets and the behavior of models to identify and rectify unwanted biases where certain

groups of people are treated differently to others, e.g., people of color in judicial decision-making or women in processing job applications. New testing standards are also needed to ensure the performance of AI models is robust when the data being processed starts to diverge from that used to train it. Further, the opaque nature of decision-making of many deep learning AI models requires new standards to explain automated decisions in a human-understandable manner.

### Stakeholder-Related Characteristics

Stakeholder engagement is already well established in the design of human-computer interaction through frequent engagement with the intended users to develop and test through prototypes their interaction with the design. Such user engagement on AI application design will be important, especially in relation to the design of mechanisms for interacting with users via any natural language interface and when providing explanations of AI decisions. For AI however, the focus on ethical issues requires engagement with stakeholders that are more broadly considered than immediate users or customers of an AI system. Appropriately therefore, ISO standards define a stakeholder as any individual, group, or organization that can affect, be affected by, or perceive itself to be affected by a decision or activity or more broadly as any entity with an interest in an organization's decisions or activities. The ISO standard for social responsibility places recognition of and engagement with stakeholders at the center of its guidelines (ISO 26000:2010) and is therefore referenced in SC 42 standards activities related to governance, as well as other ethical and societal issues. Social responsibility guidelines are structured in relation to how stakeholders are classified in relation to established legislative and regulatory structures. These social responsibility stakeholder classes can be characterized as people in general in relation to human rights issues; workers in relation to labor practices; future generations in relation to environmental issues; value chain partners, i.e.,

suppliers and customers, in relation to fair operating practices; individual users in relation to consumer issues; and people in locales where organizations operate in relation to community involvement and development. Social responsibility issues therefore provide a good basis for exploring common approaches to issues that have not yet attained widespread consensus as ethical principles, including fairness in distributing the benefits and harms resulting from the use of AI, global considerations of operating in locales with differing levels of protective legislation for stakeholders, labor displacement through automation, and the carbon and pollutant emission growth associated with some AI use.

One area where stakeholder considerations are leading to standards relevant to trustworthy AI is in data protection. Existing data protection and privacy laws, such as the European Union's General Data Protection Regulation (GDPR) and the California Consumer Privacy Act, already support common development practice in privacy by design and data protection impact assessments and common operational practices through obligations to data subjects related to notification of and consent to processing of an individual's data. The transparency and accountability required regarding information retained by organizations, either directly or indirectly in trained AI models, have the potential to support new approaches to detecting and mitigating AI bias. Work toward machine-readable privacy policies and interoperable data processing consent receipts demonstrates paths to standards in this area. Obligations related to automated profiling and algorithmic decision-making may also motivate standardization on the capabilities of AI training datasets and AI models, as well as on explainable AI.

Consistent with the emphasis on personal characteristics and behavior of virtue ethics, the IEEE Ethically Aligned Design and others have suggested that the ethical considerations of AI could be based on a professional oath undertaken by AI practitioners, similar to the Hippocratic oath universally undertaken in the medical profession. Adherence to ethical standards of practice is already expected from members of professional

bodies such as the Association for Computing Machinery and the IEEE. However, such professional membership is rarely required of practitioners or even necessarily as an aid to a successful professional ICT career. Therefore, unlike medical and legal professionals, the breach of professional ethics in ICT lacks the sanction of a bar to practice. Further, many governments and companies actively pursue the broadening of access to AI development skills as an economic imperative through low-cost training, which is bolstered by rapid advances in AI development tools to make them accessible to non-ICT or data science professionals. It is unlikely therefore that any form of standardized practitioner oath will have a major impact on trustworthy AI practice.

### Governance-Related Characteristics

Standards are already available to address the governance of IT by organizations that are extended to address the governance of AI. AI governance would address how the governing body of an organization directs the management of AI in an organization through specification of strategies and policies, how it evaluated proposals and plans from managers to implement these, and how it monitors the performance and conformance of that implementation. For organizations using AI, such governance needs to address issues and risk management related to areas such as automated decision-making, the handling and processing of data, the alignment of AI development and operation to values expressed in policies, compliance to regulatory and other requirements of external authorities, and being transparent and accountable against stakeholder expectations. Apart from data protection, the regulatory and legislative environment for AI is not currently well developed. AI governance standards may need to develop to support different models meeting obligations to external authorities. Possible structures for governing AI could include new national (Tutt 2016) and international (Erdélyi and Goldsmith 2018) regulatory bodies that engage with organizations to co-regulate the

technology. Alternatively, self-regulation may be possible by internal ethics boards that may help organizations implement best practice (Calo 2013; Polonetsky et al. 2015). However, AI governance presents a number of challenges for both organizations and regulators. Scherer (2016) identifies challenges including reaching stable consensus on what defines AI for governance purposes, the widening access to AI skills and computing infrastructure that serve to obscure AI developments from regulators, the diffusion of AI development over locations and jurisdictions globally, the emergence of impacts of an AI system only after being deployed in an application, the resistance of modern machine learning to yielding clear explanations of its behavior, and the potential for AI-driven autonomous systems that can behave in ways that may elude monitoring or outpace the control of those responsible for them. More broadly, development of regulation is challenged by a variety of factors including the pacing problems where AI technology develops faster than societies' ability to regulate it, the international economic and military competition that may impede cooperation needed between major powers in developing common standards, the perceived impediment of regulation to AI innovation and its economic and social benefits, and the power asymmetry caused by AI implementation capability being concentrated in the hands of a small number of large corporations (Calo 2017). To date, these factors have not visibly impeded standards development, with JTC1/SC 42 actively developing AI governance, AI risk management, and AI management system (AIMS) standards. Uncertainty about the direction of AI regulation may also direct governance standards to AI specializations of proposed self-regulation standards such as technology ethics review panels (CWA 17145-1 2017) and ethical impact assessments (CWA 17145-2 2017).

## Supervisor-Subordinate Guanxi

Zhenzhen Li

School of Management, Department of Business Administration, Fudan University, Shanghai, China

## Synonyms

Workplace relationships

## Definition

Supervisor-subordinate guanxi refers to nonwork-related or personal ties, which differ from the work ties that capture the connections based on task activities among these supervisor-subordinate relationships. Ganqing (affection, emotional bonding), renqing (the reciprocal exchange of favors), face, interpersonal-life inclusion/social interactions after work, and xinren (trust) are the most frequently mentioned components of guanxi in the workplace (Zhai et al. 2013). Moreover, “deference to supervisor” is also regarded as another dimension that reflects the guanxi existing between employees and their supervisors (Chen et al. 2009). Examples of good supervisor-subordinate guanxi include various after-work activities, like home visits or having dinner together, attending weddings, and so on. Moreover, employees may visit their

supervisors or send them gifts during major festivals, like the Chinese New Year.

## Description

Employees are often embedded in relationship networks in order to accomplish their tasks. Among the various relationships within these networks, arguably the most important ties are those existing between an employee and his/her supervisor (Zhang et al. 2015). There are two categories of supervisor-subordinate relationships (Boyd and Taylor 1998). One is referred to as a work tie, which captures the connections built upon task activities through which work-related resources and affect are exchanged. These supervisor-subordinate work ties are often exemplified by leader-member exchange (LMX) theory and are extensively documented in the literature (Dulebohn et al. 2012; Graen and Uhl-Bien 1995).

The other category is nonwork or personal ties, which represents the connections that arise from social interactions beyond the work domain and involve more socio-emotional goals, including intimacy and companionship (Boyd and Taylor 1998). As we know, “guanxi” is a general Chinese term used to describe relationships that may result in the exchanges of favors or “connections” which are beneficial to the parties involved. Thus, such nonwork-related or personal ties between employees and their supervisors can be called supervisor-subordinate guanxi in the Chinese context.

## The Reason Why People Pursue Supervisor-Subordinate Guanxi

Pearce et al. (2000) claimed that managers in transitional societies (like China) have more latitude when making decisions and do not need to follow prescribed rules due to a lack of monitoring regulations and their reliable enforcement. Luo (2009) made a similar claim that guanxi plays a vital role in Chinese culture and people often pursue it in order to reduce their social uncertainty, particularly political and legal uncertainty. In an organization, the superiors are responsible for hiring, promotion, rewards, punishment, and

the evaluation of political attitude (Luo 2009), so they have the power to “hire those they like, reward those they like, and dismiss those they don’t like” (Pearce et al. 2000). Thus, people are motivated to invest in particularistic relationships with those in authority, such as their supervisors, to seek protection or career advancement. These particularistic ties can offer subordinates job security, which facilitates their effective functioning within the organization (Han and Altman 2009), and cannot be produced by work-related interactions alone.

## The Five Components of Guanxi in Workplace and Other Related Elements

The most frequently mentioned components of guanxi in the workplace are ganqing (affection, emotional bonding), renqing (the reciprocal exchange of favors), face, interpersonal-life inclusion/social interactions after work, and xinren (trust) (Zhai et al. 2013). These five components are intertwined, and the core components are ganqing and renqing.

Ganqing, the most frequently discussed element of guanxi, refers to the degree of emotional understanding and connection between two people and is reflected in the sharing of feelings of happiness or fear (Chen and Chen 2004). Ganqing is an indicator of the emotional strength of the guanxi. If the supervisors and employees can enjoy some social activities and exchange favors outside work, the ganqing between the two parties may be considerably improved.

Renqing consists of two parts, reciprocity and empathy, and is practiced through the exchange of favors (Luo 2007). To some extent, it is the sense of obligation and indebtedness that results from social and economic transactions. In the workplace, if a supervisor receives a favor from his/her employee, like looking after his/her children, he/she will be prepared to repay this favor later. The supervisor may invite the employee to dinner to express his/her gratitude, for example. Such renqing is based on the mutual trust existing between the supervisor and employee and can further enhance their trust in each other.

Face, the third component of workplace guanxi, refers to one's respect, status, and moral reputation in Chinese society (Bedford 2011; Zhai et al. 2013). Face also consists of two parts, *mianzi* (i.e., status, prestige, and respect) and *lian* (the moral aspects of face), according to Bedford (2011). Face is not due to status but rather to the trust that is built up within a relationship over time. In the workplace, if a supervisor trusts his/her employee, that the supervisor will accept his/her employee's favor, in which case face transaction occurs, and vice versa.

Personal-life inclusion, the fourth element of guanxi, refers to the degree to which subordinates and supervisors are included in each other's private or family lives (Chen et al. 2009). Examples include various after work activities, like home visits or having dinner together, and attending each other's significant private events, such as weddings, birthday parties, and so on. These activities can help to improve the level of affection among people (Bedford 2011; Zhai et al. 2013; Yen et al. 2011). However, Zhai et al. (2013) argued that personal-life inclusion may be a double-edged sword. For some people, who have a genuine affection for their supervisor, personal-life inclusion can help to sustain high-quality guanxi, while other employees may find this personal-life inclusion a burden, and so it becomes detrimental to the formation of good workplace guanxi.

Xinren (trust), the fifth element of workplace guanxi, entails the recognition of the other party's integrity or credibility (*lian*) and their commitment to the relationship through favor-seeking and return (Bedford 2011). During the guanxi development process, trust related to the character of the target person is key (Bedford 2011). In addition, *xinren* is often linked with another term, "*xinyong*," which implies the trustworthiness of a person and refers to a person's reliability and sincerity (Chen and Chen 2004).

In addition to the above dimensions, other elements of supervisor-subordinate guanxi exist. Chen et al. (2009) developed a three-dimensional concept of supervisor-subordinate guanxi, including deference to supervisor, and two components which were introduced above, affective

attachment and personal-life inclusion. Deference to supervisor refers to the degree of obedience and devotion the subordinate expresses toward his/her supervisor (Chen et al. 2009). According to the findings of anthropological studies, in an authority relationship (such as that between a supervisor and subordinate), subordinates should show obedience and deference to authority (Chen et al. 2009). In particular, China has a high level of power distance culture, which implies that there exists a high level of power disparity between superiors and their subordinates and a high level of acceptance of such disparity (Chen et al. 2009). Thus, in Chinese culture, this can lead to enhanced deference to the authority of those of higher status.

### How to Establish and Maintain a Strong Dyadic Guanxi

Given the importance of both work-oriented (i.e., LMX) and nonwork-oriented relationships (i.e., guanxi) in determining an employee's professional (and sometimes personal) fate, employees are urged to take advantage of every opportunity, both inside and outside the workplace, in order to establish and maintain a strong dyadic relationship with their supervisors (Zhang et al. 2015); for example, in order to maintain good guanxi with their supervisors, employees may visit their supervisors at home or send them gifts during major festivals, such as Chinese New Year and so on. Meanwhile, leaders may also reward their followers from their own pocket, such as inviting their employees as a group to have a dinner, to show his kindness or gratitude for their hard work during the previous period. Further, employees and supervisors can establish and maintain strong personal ties outside work via these nonwork and informal social interactions (i.e., guanxi).

### Leader-Member Guanxi (LMG) Versus Leader-Member Exchange (LMX)

LMX, a relationship-based approach to leadership that focuses on the two-way (dyadic) relationship between leaders and followers (Graen and Uhl-Bien 1995), suggests that leaders develop an exchange with each of their subordinates and that

the quality of these leader-member exchange relationships influences subordinates' responsibility, decisions, and access to resources and performance (Deluga 1998). Similarly, guanxi also focuses on the vertical relationship between followers and supervisors. However, unlike LMX, that is primarily restricted to work-related exchanges, guanxi is based on personal connections developed outside the work domain and also to nonwork-related exchanges (Law et al. 2000).

The sharp distinction between these two constructs originates from the different social and organizational realities inherent in developed Western countries and transitional Eastern societies (Zhang et al. 2015). Compared to LMX, leader-member guanxi, the distinctly indigenous Chinese construct, is more deterministic in nature. The commonality of shared identification, such as locality or dialect (tongxiang), fictive kinship (people sharing the same last name), kinship (immediate family), workplace (tongshi), and friendship, can help two strangers to establish guanxi and so reduce the uncertainty. LMG is often considered to be more exclusive than LMX because it allows the parties' mutual access to each other's personal lives (Chen et al. 2014).

### The Supervisor's Guanxi Circle

People often build up a guanxi circle in the workplace (Luo et al. 2016). Guanxi circles can be very effective and efficient work units. The network structure of a guanxi circle in a workplace is illustrated in Fig. 1. Supervisors often divide their in-circle subordinates into core and peripheral members. Circle cores and peripheral members are centered around the supervisor. Both

of these two types of circle members are "in-group" members for the supervisor.

Supervisors may categorize their staff members into in-group and out-group members and apply different rules of social exchange to them (Luo and Cheng 2015). That is to say, some individual subordinates are excluded from the supervisor's circles, so they are "outsiders" or "out-group" members in the organization. For those in-circle subordinates, working hard, sharing resources, and offering extra services can help them get appreciation of the supervisors and move ahead. On the other side, outsiders (out-circle members) are often excluded from all favor-exchange networks.

### The Outcomes of Supervisor-Subordinate Guanxi

Supervisor-subordinate guanxi is linked to various work-related and organizational outcomes, such as job satisfaction and organizational commitment, turnover intention, participative management, and organizational citizenship behavior (Zhai et al. 2013). Cheung et al. (2009) argued that job satisfaction mediates the relationship between supervisor-subordinate guanxi and work outcomes (namely, organizational commitment, intention to leave, and participatory management) and suggested that firms should pay more attention to employees' job satisfaction so that the supervisor-subordinate guanxi can be effectively translated into positive work outcomes. However, the variance in LMG quality within a work group (i.e., LMG differentiation) generally has negative implications with respect to job satisfaction, organizational commitment, intention to stay with an organization, and

**Supervisor-Subordinate Guanxi, Fig. 1** The structure of a supervisor's guanxi circle (Luo et al. 2016)

coworker helping behaviors, due to justice concerns (Chen et al. 2014). Positive guanxi with a supervisor is also related to preferential decisions, in which the connected subordinate receives greater benefits than his/her colleagues (Law et al. 2000; Wei et al. 2010). From the perspective of guanxi circle, Luo et al. (2016) claimed that out-group subordinates of the supervisor have a lower level of organizational citizenship behavior than in-group members, while peripheral members have a higher level of organizational citizenship behavior toward organizations than core members.

In summary, personal ties between the supervisors and their subordinates may be a double-edged sword and, accordingly, should be handled with caution. On one hand, personal ties benefit the collective group or organization by fostering increased extra-role behaviors. On the other hand, they may raise ethical concerns and cause negative consequences such as cronyism, sexual harassment, and lessened loyalty to the organization (Zhai et al. 2013). Thus, managers are advised to avoid hiding their social interactions with certain subordinates and instead should bring them in public and provide explicit explanations or justifications for maintaining personal ties. Doing so enhances subordinates' perceptions of relevance and legitimacy of using personal ties as management practices (Chen and Chen 2004).

## Sustainability and Bioethics

Cristina Richie  
Philosophy and Ethics of Technology  
Department, Delft University of Technology,  
Delft, The Netherlands

## Synonyms

Environmental bioethics; Green bioethics

## Introduction

Bioethics was originally an ethical system concerned with the “problems of interference with other living beings” according to the 1978 *Encyclopedia of Bioethics* (Reich 1995). Conceptually, bioethics was broader than the patient–physician relationship. The scope was global, not local; inclusive, not exclusive. And while the development of bioethics as an academic discipline gave the appearance that ecology was separate from medicine, environmental bioethics has brought the two together. Environmental bioethics, which at once addresses the environmental impact of the medical industry and climate change health hazards, is a dynamic discipline. Simultaneously, thematic elements such as interconnectedness of planetary health and human health, dedication to living in harmony with nature, and emphasis on systems and symbiosis remain unchanged.

## Scope

### Climate Change

Climate change refers to the drastic acceleration of extreme weather and extreme weather events which is unprecedented at any time in recorded

written history. Anthropogenic, or human-caused, climate change is the primary issue of ethical concern. Modern human activities emit greenhouse gas emissions (GHG) like carbon dioxide (CO<sub>2</sub>) in unprecedented amounts, as a result of excavation and use of resources. Global CO<sub>2</sub> emissions – an indicator of human resource consumption – increased an astonishing 4.4% between 2008 and 2010 alone. Safe amounts of global carbon emissions, measured in parts per million (PPM) – which is a way of measuring the ratio of carbon dioxide molecules to all of the other molecules in the atmosphere – has been exceeded. There is “clear evidence that the composition of the atmosphere is being altered as a result of human activities and that the climate is changing” according to the Environmental Protection Agency and numerous other scientific sources.

### Climate Impacts

The impact of carbon emissions includes not only climate change, but also health hazards like pollution, significant environmental destruction, violent conflict over scarce resources, loss of biodiversity, and diminished quality of life for humans (Costello et al. 2009). As a response to anthropogenic climate change nearly every sector of public and private life has sought to undertake positive steps to reduce carbon. Many scholars trace the budding of a conservationist consciousness in the United States to Aldo Leopold’s *A Sand County Almanac and Sketches Here and There* in 1949, while Rachel Carson’s seminal text, *Silent Spring* in 1962, is credited with spawning the environmental movement. Paul Ehrlich’s *The Population Bomb* from 1968 had a lasting influence on ecology, as well, by linking human reproduction with resource depletion. The first United Nations Conference of the Parties (COP) in 1995 brought together international leaders to discuss, and effect, climate change solutions and numerous academic disciplines have addressed climate change as well.

### Environmental Ethics

Environmental ethics has been examining the issues of resource use and carbon emissions as a

result of human activities – including biological reproduction which increases pressure on the earth's ability to sustainably provide natural resources – for at least a century. At the same time, the health effects of climate change and carbon emissions have been a topic of discussion in public health and health care.

### Environmental Bioethics

In the twentieth century, environmental bioethics has united the ethical commitments of health care ethics and environmental ethics. Environmental bioethics is a dynamic discipline that focuses on two areas: climate change health hazards and the environmental impact of the medical industry (Pierce and Jameton 2001). The former traces its origins to public health and public health ethics while the latter emerges from environmental ethics with emphasis on the health care industry.

The documented effects of global warming include climate change health hazards, which refer to the health effects of climate change. These include death and injury from severe weather like flooding, tornados, and hurricanes which are intensified because of climate change, as well as famine, vector-borne illness, and heat.

The environmental impact of the medical industry includes carbon emissions and resource use. The carbon emissions of global healthcare activities make up 4–5% of total world emissions, placing the healthcare industry on par with the food sector (Pichler et al. 2019). Healthcare carbon within countries varies. In a study published in 2019, the US healthcare industry expended an estimated 479 million metric tons (MMT) of carbon dioxide per year; nearly 8% of the country's total emissions.

Both climate change health hazards and the environmental impact of the medical industry can be separate ethical issues but environmental bioethics underscores the connection between the two through normative and applied ethics. Normative ethics describe actions that may be morally right or wrong. For instance, US healthcare produces 9% of total world air pollution emissions causing over 4,35,000 Disability Adjusted Life Years (DALYs) worldwide, which is ethically problematic in that these cause harm to humans. Applied ethics offers solutions for ethical

problems. For instance, since carbon emissions contribute to poor health conditions related to climate change health hazards, the medical industry should have an interest in sectoral carbon reduction as a means to reduce disease burden since carbon is counterproductive to patient health.

Environmental bioethics has connections with a number of other ethical disciplines, such as business ethics and the corporate social responsibility to reduce carbon emissions; theological ethics, which underscore the God-given imperative to take care of the earth; queer ethics, which emphasizes non-reproductive and other non-consumptive ways of life over biological reproduction; and global bioethics, which addresses health care gaps and access in the developing world – among others.

Due to both its breadth and its agility, environmental bioethics often suffers from an identity problem in that, disciplinary, it does not clearly fit within any one discipline and so often gets ignored or becomes invisible. This is due, in part, to the intellectual and topical development of environmental bioethics.

## History

### Bioethics

Bioethics was predicated on the work of two men – Fritz Jahr in Germany – and Van Rensselaer Potter in the United States (2010). In 1927, Fritz Jahr described bioethics (German: *bio-ethik*) as “the assumption of moral obligations not only towards humans, but towards all forms of life.” Jahr summarizes his philosophy by declaring, “Respect every living being on principle as an end in itself and treat it, if possible, as such”! Almost half a century later, the term “bioethics” appeared in English.

In 1971, Van Rensselaer Potter advanced the term bioethics as a way to describe “a global perspective with an ecological focus on how we as humans will guide our adaptations to our environment.” This life (*bios*) ethic emerged from a tangible need to evaluate the actions of humans in an industrialized society struggling within a precarious ecosystem. Trained as an oncologist,

Potter was particularly sensitive to the connections between health and habitat. Thus, he conceptualized a humanistic ethical system rooted in an intrinsically practical approach to a sustainable life, inclusive of the earth and other organisms.

### Biomedical Ethics

Despite the foundational work of Jahr and Potter, a second way of defining “bioethics” appeared in academia and medicine. The so-called Georgetown mantra – respect for patient autonomy, beneficence, non-maleficence, and justice – which was developed by Tom Beauchamp from the Philosophy Department and James Childress of the Religious Studies department at Georgetown University became the standard ethical system for philosophy departments and medical schools (1979). Following from this formalization of biomedical ethics, numerous research centers connected to universities and hospitals arose, focused on the four principles of bioethics to the exclusion of Jahr and Potter’s original concept. Thus, the environmental component to biomedical ethics was forgotten by students, teachers, and practitioners.

### Environmental Bioethics

The development of bioethics as an academic discipline, which focused on patients and doctors within the hospital and health care facility gave the illusion that the environmental issues were separate from health care. Indeed, when Potter published *Global Bioethics: Building on the Leopold Legacy* in 1998, he lamented that modern bioethics went in a drastically different direction than he envisioned, writing “with the focus on medical options, the fact that bioethics had been proposed to combine human values with ecological facts was forgotten by many: the ethics of how far to exercise technological options in the exploitation of the environment was not associated with the term bioethics.” Here, the identity problem is the supplantation or cooptation of bioethics by biomedical ethics and the erasure of the origins of bioethics as an ethical system tied to the environment. Thus, the term “environmental” began to stand as a modifier to “bioethics” and “environmental bioethics” developed its own scholars and

literature, which led to more environmentally sustainable health care curriculum in medical schools.

## Modern Movements

### Scholars

Notably, the “father” of environmental bioethics was a biochemist and professor of oncology. Van Rensselaer Potter’s first book *Bioethics: Bridge to the Future* (1971) detailed “a global perspective with an ecological focus on how we as humans will guide our adaptations to our environment.” Potter saw the interconnectedness of humans and nature as self-evident and, given that humans are situated in a natural environment, sought to connect humans not only to health within the hospital, but to holistic life in the world of nature as well. In 1988 Potter published his second and final book, *Global Bioethics: Building on the Leopold Legacy*. *Global Bioethics* brought the medical industry – made by and for humans – back to the land, and acknowledged how far we had come from “nature.” Potter’s work connected conservation and medicine and laid the foundation for environmental bioethics to develop.

About a decade elapsed between Potter’s last book and the next wave of conservation-based medicine. In the late 1990s Jessica Pierce appeared as a major advocate for environmentally sustainable advances in medical and hospital practices. Pierce was influenced by Potter and indebted to his initial work and wrote on a number of environmental topics for a health care audience, greening health care products and the public health impacts of resource use. Connecting what happens within the walls of hospitals with the outside world of nature lead to specific avenues for change. Reducing the use of hazardous chemicals in facilities and using environmentally friendly cleaning products is now a common practice in many hospitals.

### Literature

The years between 2000 and 2003 saw growing academic interest in environmental bioethics and issues related to human health and planetary

sustainability. Literature that was the lifeblood of physicians and bioethicists began to explore the multifaceted approaches to environmental bioethics. Between 2000 and 2001 the *Canadian Medical Association Journal* published numerous articles on the ecosystem and health, spearheaded by Michael McCally. Around the same time, in 2002, the *Journal of Medical Humanities* dedicated an entire issue to the declining environment and health care. The efforts of these two journals expanded the discipline of environmental bioethics from a purely scientific, medical pursuit to one that embraced ecology, philosophy, religion, and ethics. With many entry points into the conversation, physicians could advocate for sustainability within their own practice from a number of angles.

Later, in 2012, David Resnik's *Environmental Health Ethics* traced many of the same paths that Potter and Pierce had created, while also expanding on issues of nutrition, natural disasters, and public health, thus two bringing environmental bioethics back to the forefront of medicine. In 2019, the first comprehensive ethical methodology developed specifically for environmental bioethics was created by Cristina Richie. "Green Bioethics" proposed a principle-based system similar to Beauchamp and Childress's principles of biomedical ethics which assesses the sustainability of medical developments, techniques, and procedures based on four principles: distributive justice, resource conservation, simplicity, and ethical economics (2019). The scholarship on environmental bioethics began to influence curriculum in higher education.

### Curriculum

As of 2019, medical schools in at least 92 countries have topics related to climate change ethics and environmental sustainability in their curriculum. In 2020, 20 out of 30 reporting medical schools in the United Kingdom included "future impact of climate change on health and healthcare systems" as a learning objective, while 25 listed "environmental and occupational hazards and ways to mitigate their effects" as a learning objective (Walpole et al. 2019). New York University (NYU) offers a Masters of Arts in Environmental Bioethics and a 5-year MD/MA program, which

has two tracks leading to the terminal degree – one of which focuses on environmental issues. The medical school curriculum trains doctors to be aware of the environmental consequences of carbon emissions which bolsters support for sustainable health care institutions and initiatives.

### Institutions

Many health care organizations including Healthcare Without Harm, Practice Greenhealth, the Healthier Hospitals Initiatives, the Catholic Health Association, and UK's National Health Service have recognized the connections between the carbon emissions of health care and climate change. These, and other, organizations, have implemented initiatives such as recycling and clean energy purchasing. Most early sustainability programs were imported from general business frameworks which only focus on the external aspects of sustainability and did not address the internal health care carbon unique to the medical industry. That is, the carbon that is produced by hospitals and clinics such as water sourcing, energy, and food, patient transportation to and from hospitals, and doctors commuting to work and as well as shipping products to health care facilities was evaluated. Later, the carbon of health care delivery, which includes emissions from medical tests, bedside care, single-use instruments, and pharmaceuticals, as well as medical developments, techniques, and procedures were addressed in initiatives, policy, and law.

### Initiatives

The UK's National Health Service is the only publicly held health care system that has legally binding carbon reduction measures. Following from the UK Climate Change Act of 2008, the *Saving Carbon, Improving Health: NHS Carbon Reduction Strategy for England* encouraged carbon-neutral transportation – like walking and biking to and from work – eliminating animal-based foods from menus, and reducing water waste in health care facilities to meet carbon reduction standards (National Health Services Sustainable Development Unit 2009). Similarly, the NHS *Climate Change Strategy for Wales*, released in 2010, outlined policies for sustainable

health care based on the groundbreaking data from the Carbon Footprint of NHS Wales 2005–2009 study. Efforts in Scotland to reduce carbon emissions include NHS *Scotland's Climate Change Plan* from 2017 and support from the Scottish Public Health Network and Scottish Managed Sustainable Health Network, which also addresses climate change health hazards.

Despite many developments in environmental bioethics, it still suffered exclusion from the traditional scope of biomedical ethics. Since it is interdisciplinary, environmental bioethics tends to be placed in the scope of environmental ethics, thus isolating academic environmental bioethicists from biomedical ethics, and simultaneously, downplaying the ethics of carbon reduction in health care organizations.

## Future Directions

### Carbon Calculations

Environmental bioethics is agile. It continues to expand its scope of concern, rightfully advocating for carbon reduction in the medical industry. Given the move towards carbon reduction as the primary metric of sustainability, a number of studies on the carbon footprint on specific procedures in specialty areas such as gynecology and obstetrics, ophthalmology, anesthesia, urology, dentistry, internal medicine, and pathology have been published. This qualitative data will reinforce justification for effective carbon reduction policies and practices in health care organizations.

### Coronavirus Pandemic

The Coronavirus pandemic reiterated the importance of environmental bioethics for health in a variety of ways. First, the precautionary measures of social isolation remind the human collective that we are all interconnected. One person's actions affect another and may set off a chain reaction with international implications. Humans have adapted to thinking in terms of long-range cause and effect by understanding the spread of Coronavirus via human contact. The carbon impact of medical consumerism is similar in that medical choices emit carbon which continues to

climate change health hazards and that affects others.

Second, many people have lived through restrictions where movements were considerably limited, through shielding for those of advanced age and with weakened immune systems and mandated home quarantines for people who tested positive for the virus. Road closures, domestic bans, and closed borders prevented travel. These, and similar measures will become more a commonplace unless carbon emissions are reduced and climate change health hazards are minimized. All adults will need to stay indoors when air quality compromises respiratory health. Severe weather will close access points, leaving thousands of people stranded. As with the Coronavirus, the elderly and vulnerable will be most affected.

Third, the devastating economic effects of the Coronavirus have illuminated the need to rethink commerce. Certain businesses that provide “fast fashion,” lifestyle trends, other “non-essential” services were forced to close physical shops, while sanitation, health care, and education continued. The parallels between COVID-19 and climate change has offered environmental bioethics a platform to address carbon reduction in health care by making these tangible connections.

As environmental bioethics attempts to maintain relevance, the identified problem of “greenwashing” may hinder authentic change. “Green” may be the buzzword of the twenty-first century, but sustainable health care and a clean living environment will be perennial ethical demands of both biomedical and environmental ethics in the future.

economic, social, environmental, and governance performance and publicly releasing this in the form of a report. Sustainability reporting can be undertaken by many types of organizations. While it tends to be most commonly associated with public corporations and large businesses, other organizational types like public agencies, state-owned entities, charities, and not-for-profit and small and medium enterprises also prepare sustainability reports. The form and content of sustainability reports vary considerably, but they usually include information about the economic, social, environmental, and governance impact of an organization, which can be linked to the strategy, mission, and activities it undertook over a period. Unlike traditional financial reporting, sustainability reporting shifts the locus of the user from the shareholder to the stakeholder and is therefore meant to be useful to a broader group of individuals and groups who may affect or be affected by the organization, such as staff, customers, suppliers, investors, media, government, and the broader community. The general principle that underpins the growth of sustainability reporting is that it provides more information about the impacts of the organization, thereby increasing transparency for both internal and external stakeholders and ultimately enabling the organization to be more sustainable in its activities.

The following sections introduce some key concepts of sustainability reporting, including the history, form, and standards used, key drivers and theories, and challenges and critiques of the practice.

## Sustainability Reporting

Sarah Adams  
Research School of Accounting, The Australian National University, College of Business and Economics, Canberra, ACT, Australia

## Synonyms

Corporate social responsibility reporting; Triple bottom-line reporting

## Introduction

Sustainability reporting refers to the internal process of gathering information on an organization’s

## History, Forms, and Standards of Sustainability Reporting

Sustainability reporting may be seen as the latest manifestation of a long history of nonfinancial disclosure trends. These trends have included reporting about employee issues by early corporations, social reporting that was popularized in the 1970s, and environmental reporting in the 1980s that emerged alongside public awareness

of sustainable development and ecological limitations. Then, in the 1990s, drawing upon the metaphor of a “triple bottom line,” reporting began to consider the linkages between three “pillars” of organizational performance: social, environmental, and economic.

In the 2000s, corporations and other organizations began adopting the term “sustainability reporting,” and since then, it has become increasingly common among many types of organizations, across different industries and in various jurisdictions around the world. Initially, sustainability reporting remained largely voluntary and unregulated and tended to be more qualitative in nature. More recently, sustainability reports have become more detailed and data-driven, including more metrics that quantitatively measure performance, and are more closely aligned with the particular strategies of individual organizations.

At the same time, sustainability reporting has also become more formalized through a complex constellation of different standards, guides, and approaches available to provide guidance to organizations. Probably the most dominant approach is the Global Reporting Initiative (GRI), from an international organization which provides a series of standards to help organizations “create a common language for organizations and stakeholders, with which the economic, environmental, and social impacts of organizations can be communicated and understood” (Global Reporting Initiative 2016, p. 3). The GRI standards provide principles and guidance for the reporting process, as well as a series of performance metrics that may be reported by organizations. Other standards tend to focus on the disclosure needs of particular jurisdictions – such as the Sustainability Accounting Standards Board which provides reporting standards tailored to particular industries in the United States. There are also further standards that provide guidance on disclosure on a particular aspect of sustainability: an example of this would be the Climate Disclosure Standards Board which provides a reporting framework focused on reporting climate disclosures.

## **Responsible Investors and Regulation as Drivers of Corporate Sustainability Reporting**

There are two trends that have been particularly potent in driving the expansion in corporate sustainability reporting: responsible investors and regulation.

Responsible investors incorporate environmental, social, and governance factors into their investment decisions while aiming to generate sustainable, long-term financial returns while also managing risk and supporting responsible businesses. To include these environmental, social, and governance factors into their decision-making, responsible investors require additional information about the environmental, social, and governance strategy and performance of companies. The content of sustainability reports can provide this information in a format that can be used by investors. Responsible investment has grown in scale and influence over the last decade, and the informational demand of these investors is an important driver of sustainability reporting practices among corporations.

A second driver of sustainability reporting practices is the growth in regulation of sustainability reporting in various jurisdictions around the globe. Specific requirements in different countries vary in terms of the regulator, the companies affected, and the nature of the reporting required. One example is the European Directive on Non-Financial Reporting from the European Union, which requires large public interest companies to disclose specific information on how they manage issues like environmental protection, human rights, diversity, and corruption in annual reports from 2018 onward. Alternatively, reporting requirements may come from other non-government regulatory agencies. For example, the Taiwan Stock Exchange and the Johannesburg Stock Exchange require additional disclosure requirements around sustainability for listed companies. Overall, these and many other reporting regulations have contributed to the widespread adoption of sustainability reporting in many parts of the world, such that it is now considered

mainstream business practice for most large corporations.

## Theorizing Voluntary Sustainability Reporting

A range of theories have been adopted in the academic literature to help explain the voluntary adoption of sustainability reporting by organizations; each offers different interpretations for the reasons why organizations prepare sustainability reports and the implications in doing so (Gray et al. 2010).

Firstly, organizations may be motivated to undertake sustainability reporting because of the economic benefits that this practice may offer. Sustainability reporting can trigger the organization to collect information about its performance that allows the company to understand and manage its own activities better, allowing it to improve its own financial performance. This form of communication can also have external benefits for organizations, in terms of building reputation, trust, and brand loyalty with customers and communities. Further, by offering additional information to capital markets, sustainability reporting can also reduce informational asymmetries in capital markets with benefits for investors and companies themselves. Finally, sustainability reporting may also help to alleviate the political costs borne by larger organizations or those with a high public profile.

Stakeholder theory offers a different interpretation of this practice, conceptualizing sustainability reporting as an important form of communication between an organization and its stakeholders. Normative stakeholder theory draws from deontological ethical theory and suggests that all stakeholders (not just investors) have a right to information about the organization and that sustainability reporting can discharge this accountability. Stakeholder theory can also be interpreted in a more managerial sense, where sustainability reporting is used strategically to manage stakeholder impressions and expectations about the organization, with the aim of managing stakeholder risk.

Legitimacy theory also views sustainability reporting as a managerial tool that can be used

strategically to shape the way an organization is perceived. Drawing from the concept of a social contract, this theory focuses on legitimacy threats that can arise when an organization is not perceived to be behaving in accordance with the implicit and explicit “rules” of society. Legitimacy theorists have shown how sustainability reports can be used to deflect attention or manipulate perceptions about the organization, to make the organization appear to be compliant with the social contract even without enacting substantive changes to its sustainability activities.

Finally, institutional theory has also been used to interpret sustainability reporting practices. According to institutional theory, the practices of institutional fields become increasingly homogeneous over time through the processes of coercive, mimetic, and normative isomorphism. These can place pressure on organizations to conform with the sustainability practices of other organizations, with sustainability reporting becoming increasingly similar over time. These pressures may also result in the decoupling of an organization’s actual activities and strategies from that which they disclose in a sustainability report.

These theories interpret voluntary sustainability reporting in different ways; however, they are not necessarily considered mutually exclusive and instead have been found to coexist when examining certain organizational phenomena.

## Challenges, Critiques, and the Future of Sustainability Reporting

A persistent concern about sustainability reporting (particularly voluntary reporting) is about its perceived credibility and reliability. Information is most useful to external parties, like investors and other stakeholders, if it is considered credible or believable. Legitimacy theory and institutional theory have shown, however, that the content of sustainability reports may not accurately reflect the real activities and performance of an organization. Coupled with suspicion over management motivations, sustainability reports can also be seen as too subjective, not standardized and lacking in depth. In response to

these concerns over the veracity or reliability of sustainability reports, demand for assurance has grown: whereupon independent third parties express an opinion about the veracity or reliability of particular sustainability disclosures. These assurance engagements have become more common; however, they remain complex and therefore costly, and concerns prevail about how effectively these engagements serve the needs of stakeholders.

Another concern about sustainability reporting is that these reports are perceived by many as becoming less accessible and user-friendly. As sustainability reporting has become more established, reports have expanded in terms of both scope and depth. Formal sustainability reports can therefore be extremely lengthy and complex and contain information not relevant to all stakeholders. Recently, some sustainability reports have become more engaging, moving from formal stand-alone reports to interactive websites with downloadable databases that can be analyzed by users. Future sustainability reports are likely to continue experimenting with new formats that are more accessible and engaging for stakeholders.

Critics also argue that sustainability reports do not connect well with the unique strategy and value drivers of each company and also that they are focused too much on the past rather than the future of the organization. To address this, the new approach of integrated reporting has recently been proposed, which combines financial and sustainability information into “a concise communication about how an organisation’s strategy, governance, performance and prospects, in the context of its external environment, lead to the creation of value in the short, medium and long term” (International Integrated Reporting Committee 2013, p. 7).

Other critics target the limitations of sustainability reporting in truly addressing the issue of sustainability. According to authors like Milne and Gray (2013), the increasing efforts being placed on sustainability reporting have focused too much on reporting, rather than on sustainability. Efforts to improve the quality of sustainability reports through creating standards and

accreditation deflect attention away from the profound ecological and sustainability issues that shape our world. For example, reporting by individual companies on their own sustainability initiatives fails to provide information on system-level problems like climate change and unsustainable levels of consumption in developed countries. From this perspective, sustainability reporting requires transformation so as to provide relevant information to allow us to tackle these profound, global issues.

## Synonyms

Corporate social performance in banking; Ethical banking; Social banking

## Introduction

The traditional (or conventional) financial system, whose unique objective is to maximize monetary profit, has evolved towards the so-called “ethical financial system,” which aims for more humanitarian and sustainable development. In other words, its objective is to perform the financial operations with social and environmental responsibility, thus operating ethically with its financial assets.

Ethical financial products, also called socially responsible investments (SRI), in addition to seeking profitability, must consider ethical criteria, which may be exclusive or evaluative. Investing with exclusive (or negative) criteria means not investing in any company or activity related with the violation of human rights, with drugs, child pornography, contamination, genetic manipulation, nuclear energy, weapons, tobacco, alcohol, animal experimentation, gambling, exploitation of the third world, etc. On the contrary, investing with evaluative (or positive) criteria means investing in those companies which promote equal opportunities, recycling, renewable energy, commitment to solidarity, pollution control, support for training and education, etc. It is important not to confuse ethical products with solidarity products, since the latter are conventional products (that is to say, they do not apply ethical selection criteria) which donate all or part of their profits to a social organization.

Among the SRI financial products, there are ethical investment funds and pension plans (which invest in those companies screened according to criteria established by the fund's principles), revolving funds (which grant loans to individuals or groups normally excluded from access to credit by making the obtained profits available to similar people or groups), guaranteed funds (which give support to small companies which themselves do not have access to credit), microcredits (small loans to people with few resources to develop small production projects), venture capital firms (which invest in temporal and minority capital of small- and medium-sized startups), socially responsible deposits (where the money is used to finance ethical projects and to

transfer all or part of the interests generated), and ethical banking.

The maximum expression of an SRI is ethical banking, since it manages all its business applying social and environmental criteria, in addition to those necessary for economic profitability, under complete transparency. An ethical bank has a dual objective: (1) to finance economic activities which generate a positive social and/or environmental impact and (2) to be economically viable, that is to say, to obtain profits. If the second objective is not achieved, the bank will disappear, since economic viability is necessary for its survival. Analogously, if the ethical part does not hold, it will simply be a bank in the traditional sense.

Ethical banking institutions are governed by four principles: (1) promotion of socially responsible savings (i.e., they invest in savings with ethical criteria and contribute to the progressive awareness and development of the culture of responsible savings, continually reporting on the financed projects and their social contribution); (2) promotion of SRI (i.e., they do not finance ethically reprehensible activities, invest only in projects of social and environmental content and facilitate the access to credit for groups traditionally excluded); (3) transparency (i.e., continuous and detailed information about its operations to its clients, who have the right to know where their savings are invested); and (4) democratic management (i.e., they apply active mechanisms so that their partners, employees, and savers participate in strategic banking decisions).

SRI is increasingly demanded by portfolio managers. We can find, therefore, social rating agencies which may be either profit-oriented businesses (such as, for example, Bloomberg, a database very used by investment managers) or non-profit-making organizations which, instead of measuring the credit rating of companies, evaluate them based on whether their activity meets social and environmental criteria. There are even socially responsible investment stock indices, such as the Dow Jones Sustainability Group Index, composed by listed companies based on their social and/or environmental behavior.

Ethics has been linked to banking since its conception. The first ethical banks emerged in

Italy at the time of the Renaissance, where Catholicism was the prevailing morality, so that usury was not allowed and access to credit favored those people who were most disadvantaged. The so-called “Monte di Pietà,” created by religious orders, had a social vocation. The credit cooperatives, which emerged in the nineteenth century amid in the Industrial Revolution, were created to finance local projects and favoring the savings of the working classes. However, the first ethical investment fund, the Pax World Fund, was created in 1971 alongside the pacifist movement, which arose in the USA as a consequence of the Vietnam War, as investors rejected using traditional banks when seeking to deposit their savings since they financed arms companies interested in prolonging the conflict. It was in the last three decades of the twentieth century when the first properly defined ethical banks were created: the South Shore Bank in the USA (1973), Triodos Bank in the Netherlands (1980), The Cooperative Bank in England (1992), Banca Popolare Etica in Italy (1995), and JAK Medlemsbank in Sweden (1997).

At the moment, there is no quality seal which certifies that a bank is ethical. Additionally, membership in the ethical banking movement is voluntary. Most of the members are integrated into the Global Alliance for Banking on Values (GABV), founded in 2009, as an international network of banks whose aim is to change the banking sector to offer more transparency and support sustainable economic, social, and environmental development.

## Ethical Versus Conventional Banking

The fall of the American giant Lehman Brothers in 2008 started a financial crisis in the principal developed countries. Its aftereffects have been felt for more than a decade. In reality, the cause of the crisis was that banks had previously adopted an irresponsible loan policy and had recklessly accumulated too many toxic assets. This situation was not foreseeable, since the traditional banking system was subject to strict regulation and projected an image of security and risk control. However, governments in many countries had to take measures to guarantee the deposits of savers,

providing financial aid to banks and even nationalizing some private institutions. This led the Basel Committee to apply strict control measures between 2012 and 2019. However, although banks exhibited a lack of morality, they did not behave contrarily to established laws. It can be said that the cause of such a crisis was not only economic but also ethical. Consequently, the introduction of stricter regulation will not be enough to prevent problems arising from former decisions. What is needed is a change of mentality towards virtue-based ethics (Knights 2009).

The so-called ethical banks have therefore chosen a different business model, where profit is considered as a means to an end and not as an end itself. They are proactive banks in creating a sustainable world and should serve as an inspiration for the traditional banking sector. Ethical banking emerged linked to the concepts of SRI and corporate social responsibility (CSR). The first characteristic adds a social dimension to the traditional economic criteria of banks, while the second is necessary for the activity of banks to have a positive influence on society. Since the financial crisis of 2008, those banks, which consider people above economic profit, have achieved wide recognition and have grown increasingly in number and strength. Two fundamental factors can be identified which explain the success of ethical banking (Salzmann 2013):

- The distrust towards conventional banking since the beginning of the financial crisis.
- The growing interest in sustainability, which has led to the transformation of an “economy centred on the money” in a “sustainable economy, focused on social and environmental issues.”

Nowadays, socially and environmentally committed banks will have a competitive advantage over other banks which do not make such efforts. The ethical financial activity must promote real or productive economic activities and achieve the common good over individual well-being (Callejas-Albiñana et al. 2017). Companies operating in the financial sector, especially banks, due to their huge impact on society, are a key element in bringing about a change in economic activity

with regard to sustainable development. For example, banks may offer loans at lower interest rates when the borrower allocates the money to sustainable social or environmental projects.

It is evident that, since the beginning of the financial crisis, conventional banking has begun to take its first steps towards sustainability either by means of the disclosure of CSR reports, the commercialization of responsible products (e.g., investment funds or pension plans), or through sponsorship or charitable donations. However, it still has a long way to go in order to achieve a total change in policies, which would raise entities to the category of ethical banks. Transparency versus opacity in information on asset investment is a differential characteristic of ethical banking compared to conventional banking. In ethical banking, depositors know the destination of their investments, i.e., the identity of those who will be making use of the money which they have deposited (San-José et al. 2011). Speculative transactions, which were the main problem of traditional banking, are rejected by ethical banking, which focuses on activities with a positive impact on the real economy. Ethical banks cover certain needs, which are not met by conventional banking, and play an active role in combating the financial exclusion of companies and projects belonging to the social economy (Global Alliance for Banking on Values 2015).

Consequently, there are two banking business models: conventional banking, which had to make changes in its behavior after the financial crisis, and ethical banking, whose behavior has been scarcely altered by the new financial context. Table 1 reflects the main differences between ethical and conventional banking.

**Ethical and Conventional Banking in Europe**

Ethical banking, strictly speaking, that is to say, excluding what might be called “poverty relief banking” is, in essence, a European phenomenon. Compared to conventional banking, it is composed of small entities, the largest being Triodos Bank (a Dutch bank operating in Spain, Belgium, Germany and UK in addition to Holland) and Crédit Coopératif (located in France). Most European ethical banks are very small in size, such as the Ecology Building Society or Charity Bank, which operate in the UK.

While the financial crisis which began in the first decade of the twenty-first century questioned the behavior and survival of conventional banking, a group of small banks, of relatively recent creation, easily overcame the problems of this crisis. Conventional banks focus on profit maximization, while their social counterparts are based on three nonexclusive objectives: profit, people,

**Sustainable and Conventional Banking in Europe, Table 1** Main differences between ethical and conventional banking

| Feature                   | Ethical banking                                                                                                                                 | Conventional banking                      |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| Aim                       | Triple bottom line: social, environmental, and economic                                                                                         | Profit-maximizing to reward shareholders  |
| Profit                    | A means to an end                                                                                                                               | An end in itself                          |
| Investment policy         | Identifiable and acceptable practical projects                                                                                                  | Speculative transactions                  |
| Investment criteria       | Positive screen (environment, employment creation, culture, etc.) and negative screen (armament, polluting companies, child exploitation, etc.) | Profitability and risk                    |
| Loan policy               | Avoid financial exclusion                                                                                                                       | Exclusion of specific segments of society |
| Transparency              | Total transparency of information and allocation of assets                                                                                      | Lack of transparency                      |
| Geographical distribution | A low number of branches                                                                                                                        | A high number of branches                 |

and planet. This is the main difference between these two banking models.

The traditional European banking system has lost credibility after the problems which arose as a consequence of the financial crisis. These led to stagnation and even decline in its operations and, therefore, in its size. However, ethical banking has experienced spectacular growth in the same period, offering savers greater confidence in the security of their savings. This has promoted an increase in loans to real economy projects, which, in addition, develop social and environmental initiatives. That is to say, ethical banking has had a corresponding growth since the proportion of the increase in deposits has been in accordance with the proportion of the increase in loans with the aforementioned characteristics. Furthermore, the fact that the growth of ethical banking has been financed by the deposits of its clients implies that it is a type of banking independent of the financial and interbank markets. It is therefore strong enough not to suffer instability in the face of economic fluctuations. Because ethical banking has a regular income, with low volatility, makes it more stable in periods of crisis, due to its relationship with the real economy and its refusal to operate with complex financial products or those considered toxic.

With respect to the reliability for its depositors, it has been observed (Valls Martínez et al. 2020) that ethical banking is undoubtedly safer than conventional banking since it has a lower debt ratio (debt to equity ratio) and a higher guarantee ratio (obtained by dividing the total assets by the amount of the debt, which indicates the bank's ability to pay its debts with its assets). Therefore, investing in sustainable banking is safer (Cornée and Szafarz 2014). This fact can be explained in the following ways. First, ethical banks base their activities on the real economy, rejecting investments in structured and speculative products. Second, the small size of ethical banks allows both their specialization in specific sectors and a better assessment of the risk involved in the projects which they decide to finance, thus maintaining a lower rate of nonprofitable loans (Abad Segura and Valls Martínez 2018; Cowton and Thompson 2001). In addition, there will be reciprocity

between the bank and the borrower, since ethical banks grant advantageous loans for social and environmental projects, so that the borrowers, who see themselves personally supported, are less likely to default than with a conventional bank. Third, clients choose this type of bank due to its ethics, which makes it more prudent than conventional banking in its decisions.

Ethical banking is an attractive development for the financial sector. However, its model is not being adopted by conventional banks. The reasons could be the inertia and the power of the established *status quo*, the conservatism of bank managers and shareholders to change the current business model, or even ignorance of the real data offered by ethical banking regarding growth, liquidity, financial solvency, and profitability. However, ethical banking has at present only a small share of the banking market, so it cannot itself bring about a change in the global financial sector.

In order to combat any future crisis, ethical banking is an example for traditional banking (Tischer and Remer 2016), since it is less speculative, more responsible, and more oriented to the community and the environment. If a company behaves unethically, it will not be able to survive in the long term, since its reputation will be diminished. The financial sector is more exposed than any other to moral damage. Therefore, the banking system would be strengthened by the growth of banks which operate in accordance with the principles of ethical banking and, consequently, the risk for depositors would decrease. Furthermore, this type of banking offers not only economic value to its shareholders but also social and environmental profits for society as a whole.

## Sustained Corporate Illegality and the Antecedent Factors

Tulika M. Varma

Strategic PR Insights, Mumbai, India

## Synonyms

Antecedent factors; Corporate illegality; Financial performance; Institutional ascription; Legal and regulatory environment; Organizational culture; Top management characteristics; Volkswagen

## Introduction

Cases of corporate illegality that benefit the organization *primarily* have increasingly become more commonplace. Although researchers have used numerous labels to describe deviant corporate behaviors – white-collar crime, corporate wrongdoing, management fraud, corporate misconduct, managerial vice, and corporate illegal behavior – the key characteristics of these types of corporate crimes have included the existence of strong financial motivations and the involvement of individuals who are otherwise considered respectable members of society (Zahra et al. 2005). Extant scholarship has identified several antecedent factors that explain deviant corporate behavior; however, few have focused on a comprehensive review of the antecedent conditions at all the three levels – the industry-, the institutional-, and the individual-group level. Gaps, therefore, remain in our understanding of how organizations like Volkswagen concealed the emissions cheating scandal perpetrated globally between May 2008 and November 2015 despite being monitored by regulatory agencies.

This brief analysis evaluates antecedent conditions that might have contributed to the sustained illegality at Volkswagen. In addition, it introduces additional antecedent conditions – regulatory loophole, institutional ascription, and a corrupt industry culture – as being instrumental in Volkswagen’s ability to commit corporate illegality for long periods. These antecedent conditions identified in this review advance our understanding of how and why organizations commit illegality and can conceal it for lengthy periods.

### Institutional-Level Antecedents

**Financial Performance** – Research suggests that high-performing organizations are less likely to act illegally because they have less incentive to do so whereas poor performing organizations might resort to corporate illegality to survive (Harris and Bromiley 2007). Sometimes, however, even “good” firms engage in illegal behavior to maintain an upward trajectory of performance (Mishina et al. 2010). The implication is that “all organizations are vulnerable, regardless, of organizational conditions; the weak are tempted to engage in misconduct in order to gain position, the strong are tempted to maintain position” (Greve et al. 2010, p. 65). In the case of Volkswagen, it is hypothesized that to maintain an upward trajectory, it engaged in corporate illegality.

**Structural Attributes** – An organization’s size, its complexity, and the extent to which decision processes are decentralized have also been observed to create opportunities for concealment (Prechel and Morris 2010). The underlying assumption is that organizational complexity – in terms of the numbers of subdivisions, levels of management, and geographical locations – increase the opportunities for managers and employees to engage in covert illegal activities. Moreover, organizational structures “fragment information” and “diffuse responsibility,” such that participants in one part of an organization sometimes do not feel obligated to point out the wrongful behavior of employees in another part of the organization (Palmer 2008, p.115).

Complexity, in other words, compartmentalizes and obscures improper behavior and reduces the efficacy of managerial controls. It is posited that due to its size and its widespread geographical locations, management at Volkswagen was able to conceal illegality for longer periods.

**Ownership and Governance** – Ownership structure and governance patterns also provide opportunities for sustained corporate illegality. In the USA, widespread share ownership and a range of oversight measures such as the board of directors, outside directors, and independent audit committees minimize opportunities for corporate fraud. In contrast, European firms are typically controlled by small ownership groups and there are fewer shareholder protection requirements – circumstances that are conducive for fraud (Coffee 2005, 2006). It is theorized that relatively reduced monitoring in the German context provided Volkswagen with an opportunity to elude detection of its illegal practices and gave it the confidence to commit fraud in international markets too.

**Organizational Culture** – Organizational culture has also been implicated as an antecedent condition for corporate illegality because of its “normalizing” of questionable practices (Ashforth and Anand 2003). A culture that emphasizes ends at the expense of means sometimes unwittingly encourages moral shortcuts (Ashkanasy et al. 2006). Palmer (2008) concluded that the behavior of individuals within organizational settings is shaped by social influence processes such as norms of reciprocity, which draw employees within the flow of wrongdoing. Zahra et al. (2005) claim that the ethical climate of an organization is set by or significantly influenced by the actions of top management, especially the CEO. Even when the CEO does not engage in wrongdoing, he or she can still encourage it by rewarding, condoning, ignoring, or covering it up (Baucus 1994). The CEO at Volkswagen had a reputation for being a micromanager and being extremely demanding, which put undue pressure on the engineers to succeed under tough conditions (Goodman 2015). It is posited that an organizational culture that had little tolerance for

failure created pressure to commit corporate fraud at Volkswagen.

**Institutional Ascription** – The process of attributing positive qualities to an organization based on social cues, such as its status or its association with highly respected organizations (Gabbionetta et al. 2013) also contributed to the fraud committed by Volkswagen. Ascription influences judgments – specifically, positive ascriptions reduce the likelihood of diligent scrutiny by rendering it “unnecessary” (Gabbionetta et al. 2013). Institutional ascription had a particular relevance in this case. The Federal Highway Research Institute, a sister authority of Federal Motor Transport Authority (KBA), the agency responsible for providing automobiles with the roadworthiness certification before they go on sale allowed the company being monitored to test its cars itself. This illustrates how positive ascriptions attributed to Volkswagen helped it to conceal illegality.

## Industry-Level Antecedents

Industry-level antecedents too have been known to create conditions of pressures and opportunities for corporate fraud. It has been observed that the extent to which prior fraud violations within the industry have gone unpunished plays a role in the top management’s decision to commit fraud (Zahra et al. 2005).

**Legal and Regulatory Environment** – The corrupt culture in the German auto industry lacking in transparency and honesty was a key driver of the illegal practices at Volkswagen. Finding and developing deviant solutions to emissions issues related to EPA (Environmental Protection Agency) and CARB (California Air Resource Board) had become the implicit norm in the German car industry even before the Volkswagen’s emissions cheating scandal (End of a Legend: “Made in Germany” label badly damaged by car scandal. Spiegel Online 2017).

The German Regulatory oversight was minimal; penalties for violations were insignificant, as German national regulators were disinclined to handicap their home country’s auto manufacturers as compared to those of neighboring European

countries, whose regulators were presumed to be doing the same (Parloff 2018). The Germans car industry and Volkswagen in particular, came to wield a great deal of power over the government.

**Increased Regulation** – has also been observed to induce management to commit fraud (Apostolou et al. 2000). The California Air Resources Board (CARB) release of new emission standards in 2010 was significantly higher for both gasoline and diesel vehicles (Gadesmann and Kuhnert 2007). These strict US emissions standards created pressure as it was too difficult to meet the new emissions regulations while still maintaining engine performance and staying on budget. It is hypothesized that this too contributed to the corporate illegality at Volkswagen.

**Environmental Dynamism** – The speed and unpredictability of change due to technological advances and market changes – also creates pressures on the organization to commit corporate fraud. The introduction of revised and stringent carbon emission standards in the U.S. caught Volkswagen unprepared to implement those changes swiftly. It could have, therefore, contributed to Volkswagen committing fraud.

**Environmental Hostility** – Adverse market conditions such as intense competition, strict regulatory rules – that negatively impacts a company’s sales and profitability has also been implicated in encouraging corporate illegality (Szwajkowski 1985). It is hypothesized that in Volkswagen’s case unfavorable exchange rate, declining sales and inflexible labor laws created conditions of pressure to commit fraud.

**Environmental Heterogeneity** – Diverse markets, which are characterized by different sets of regulatory and legal environment, create pressure for organizations operating within them to commit a crime (Zahra et al. 2005). Research indicates that organizations that committed management fraud were characterized by greater environmental heterogeneity as compared with organizations that operated in a more homogenous environment (Saxena 2001). It is posited that Volkswagen, which operated in a more environmentally diverse market across Europe, Asia, and North America felt pressured to commit fraud to maintain its position.

## Individual- and Group-Level Dynamics

Several individual and group level characteristics have also been implicated in the creation of strong subcultures that support corporate fraud for instance high within-group task interdependence and low between-group interdependence, accountability only for performance goals but not means, group-based versus individual-based rewards, member stability and cohesion, peer-based socialization, and physical proximity (Trice and Beyer 1993). In the case of Volkswagen, it is hypothesized that strong emphasis on performance, peer-based socialization and cohesion, to the tolerance of breaches of rules to achieve the goals set up Volkswagen to commit fraud.

Unique to the context of Volkswagen was the issue of national pride. The Germans invented the automobile and are still admired worldwide today for their engineering skill. “Made in Germany” to many Germans symbolized superior engineering and quality – especially, when it came to cars (The End of a Legend: “Made in Germany” label badly damaged by car scandal. Spiegel Online. 2017). It would therefore be considered a betrayal of the German pride and honor to complain about Volkswagen’s corrupt practices. It is theorized that German National pride in its auto industry also played a part in Volkswagen’s motivation to commit corporate illegality.

## Conclusion

In sum, this review provides a holistic overview of factors at the institutional, industry, and individual-group level dynamics to explain how these different antecedent conditions provide a complex web of conditions that induced and enabled corporate illegality. The conclusion from this review have both theoretical and practical implications.

## Theoretical Implications

The antecedent conditions identified in this review as sustaining corporate illegality, can be generalized to its theoretical constructs for

example corporate industry culture, top management traits. Since many multinational organizations face similar heterogeneous conditions, they face similar opportunities and pressures. Especially, in the case of organizations, which have acquired a celebrity or powerful status due to their size or impact, institutional ascription might explain why and how corporate illegality is sustained. Cases of Enron, Lehman Bros, WorldCom, Bernie Madoff, and Arthur Anderson are just a few instances of corporate illegality where their celebrity status to some degree helped them to sustain illegality.

## Practical Implications

In the case of multinational organizations working in a heterogeneous and dynamic environment, such as in the case of Volkswagen and other auto manufacturing organizations the regulatory agencies should work to remove the regulatory and legal loopholes. The qualifications and training of the regulatory agency personnel should be periodically updated to stay ahead of the advancements in technology to be able to detect and prevent it.

## Sweatshops and Exploitation

Michael Kates

Saint Joseph’s University, Philadelphia, PA, USA

## Synonyms

Living wage; Low-wage workers; Unfair treatment

## Introduction

By even the most conservative estimates, there are thousands of “sweatshops” in countries around the world (Powell 2014). Located primarily in developing countries throughout Asia and Latin America, sweatshops are typically characterized as workplaces in which people labor in unsafe conditions for long hours and low pay (Arnold and Bowie 2003).

Although there is a vigorous philosophical debate about the ethics of sweatshops, some aspects of them are uncontroversial. For example, since sweatshops are typically found in repressive or authoritarian countries, sweatshop workers are often wrongfully deprived of basic freedoms like the right to protest or form a union. Similarly, since the vast majority of sweatshop workers are women, they are highly vulnerable to sexual abuse and harassment. There is also widespread agreement that the deaths of thousands of garment workers in industrial accidents like the Rana Plaza building collapse and the Tazreen Fashion Factory fire in Bangladesh were horrible tragedies that require improvements in workplace safety standards and compensation for affected workers and their families (Human Rights Watch 2015).

By contrast, this entry will focus on one aspect of sweatshop labor that *is* controversial: the question of whether sweatshop workers are wrongfully *exploited* and, if so, what should be done about it. At the most general level of abstraction, to say that sweatshop workers are exploited is to say that their vulnerability or desperate situation is taken *unfair advantage* of by their employers. But

beyond this truism, a wide range of disagreement remains. What does it mean to take “unfair advantage” of someone? And what is the connection between a worker’s background situation and their liability to exploitation? Since different accounts of exploitation answer these questions in different ways, it is necessary to survey a range of responses to determine the precise relationship between sweatshops and exploitation.

### Macro-level vs. Micro-level Exploitation

The first major fault line in the philosophical literature is whether exploitation occurs at the “macro” or “micro” level. According to “macro-level” accounts of exploitation, it is economic institutions or structures themselves that are exploitative. For example, Marxists believe that capitalism is exploitative because, like slavery and feudalism, it permits one class of society to coercively extract the unpaid labor of another. Since workers lack access to the means of production, they are forced to sell their labor power to capitalists without being fully compensated for their work. On this view, capitalists exploit workers *qua* capitalists and not because they are acting in a way that is especially wrong or unethical (Marx 1992).

One virtue of this account is that highlights the impact that economic institutions have on the lives of ordinary workers. If workers are exploited under capitalism, then that is due to their subordinate position in the class structure and not the bad behavior of their employers. Therefore, the only way to combat exploitation is to change the economic system.

However, there are two main problems with “macro-level” approaches. First, they seem to imply that it is impossible to treat workers fairly in an economic system that is exploitative. But even if one grants that capitalism itself is exploitative, it is not clear why the same should be said about each and every employer. There are surely some businesses that do not exploit their workers (Zwolinski 2012). Second, and related to the above point, if economic transactions are exploitative because they occur within exploitative

economic structures, then it is difficult to see how one such transaction can be morally better or worse than another. But most people agree that sweatshop workers are more exploited than highly paid tech workers even though both are employed under a capitalist economic structure.

“Micro-level” accounts of exploitation build on these criticisms and focus on defects in specific economic transactions. Although there are a number of differences among such views, the basic idea is that in an exploitative transaction both parties gain relative to non-interaction but one party – the exploitee – does not gain *enough*. More precisely, there are two dominant ways to flesh out this charge. To say that both A and B gain from a transaction but that B does not gain enough can either mean that B does not gain “enough” relative to an absolute standard like *need* or a comparative standard like *fairness* (Kates 2019).

According to micro-level accounts of exploitation based on need, workers are exploited just in case they are not paid a wage that is high enough for them to escape poverty (Arnold and Bowie 2003; Sample 2003; Snyder 2008). Employers are morally obligated, in other words, to pay their employees a “living wage,” that is, a wage that enables them to purchase a minimally decent standard of food, clothing, shelter, transportation, and health care. Thus, if workers are unable to meet their basic needs, then they are being exploited.

By contrast, according to micro-level accounts of exploitation based on fairness, workers are exploited just in case they are paid an unfair price for their labor. For example, Alan Wertheimer (1996) claims that workers are exploited if their actual wage is different from the one they *would* have been paid in a perfectly competitive market, that is, one where market actors possess perfect information and there are no externalities, transaction costs, or barriers to market entry and exit. More precisely, Wertheimer argues that the “hypothetical” competitive market price is fair because, in a perfectly competitive market, employers cannot exploit asymmetries of information or monopoly power to unilaterally dictate the terms of the exchange. Wertheimer’s standard of the hypothetical competitive market

price thus acts as a critical standard by which to assess the actual market-clearing wage.

Although both views offer compelling accounts of what makes an economic transaction exploitative, they each have their strengths and weaknesses. The primary strength of accounts of exploitation based on need is that they can clearly explain why sweatshops seem to be the paradigmatic case of exploitation. It is the desperate plight of sweatshop workers, and not simply the terms of their exchange with sweatshop owners, that seems to motivate our concern for their exploitation. The main problem with such accounts, however, is that they are unable to explain how it is possible to exploit someone who can escape poverty. Many people believe, for example, that adjunct lecturers are exploited even though they can meet their basic needs.

Conversely, the primary strength of accounts of exploitation based on fairness is that they are able to capture the concern for unfair treatment that lies at the very core of the concept of exploitation. If one party to an exchange can use the other's vulnerability or desperate situation to extract an unfair distribution of the gains of social cooperation, then they are being exploited. Moreover, since fairness-based accounts of exploitation are not tied to an absolute standard like need, they are able to explain both why it is possible to exploit someone who is not living in poverty and why exploitation occurs in a broad range of economic circumstances. There are, however, three main problems with such accounts. First, there is sharp disagreement in the philosophical literature about what fairness consists in. Second, given that large segments of the economy (including the garment industry) are characterized by razor-thin profit margins, it is entirely possible that a fair wage would not be enough to lift sweatshop workers out of poverty. But that seems counterintuitive. How can someone be paid a wage that is insufficient to meet their basic needs and yet still not be exploited? Finally, fairness-based accounts of exploitation seem to ignore the background conditions that give rise to exploitation in the first place. For one of the main reasons why sweatshop workers are vulnerable to exploitation is that they are living in unjust social and

economic circumstances. But if that is the case, then focusing exclusively on the fairness of specific economic transactions looks like a mistake.

## Exploitation and the Market-Clearing Wage

There is a more general problem facing micro-level accounts of exploitation. For whether they are based on the absolute standard of need or the comparative standard of fairness, they both agree that employers are morally obligated to pay their employees a wage that is higher than the one they can fetch on the market. They assume, in other words, that the (actual) market-clearing wage is wrongfully exploitative. But in the case of sweatshop workers, that is not as obvious as it initially seems.

On the one hand, most people believe that it is morally permissible for multinational corporations not to benefit developing world workers at all by keeping production at home. Indeed, there is widespread agreement that if firms choose not to outsource production, then that is something to be praised. On the other hand, sweatshops are the best available alternative for low-skilled workers in the developing world. Studies show, for example, that in comparison to the large number of people living on less than \$2 per day in these countries, sweatshop workers are among the best-paid workers overall. Hence that is why developing-world workers are so eager to accept these jobs, and why the growth of sweatshops has often been accompanied by a substantial reduction in extreme poverty (Powell 2014).

Taken together, these views are puzzling. If it is morally permissible for firms not to benefit developing-world workers at all by keeping production at home, then how can it be morally impermissible for them to pay developing world workers the market-clearing wage simply because that does not seem to benefit them enough? Indeed, given that sweatshop owners are already doing more than anyone else to help sweatshop workers escape poverty, it seems unfair to require them to pay sweatshop workers a wage that is even higher (Zwolinski 2007).

More formally, this puzzle can be expressed in the following terms:

1. A is morally permitted not to hire B.
2. It is better for B to be paid the market-clearing wage than to not be paid at all.
3. Since A is morally permitted not to hire B, and since it is better for B to be paid the market-clearing wage than to not be paid at all, it cannot be worse for A to pay B the market-clearing wage than for A to pay B nothing at all.
4. Therefore, A is morally permitted to pay B the market-clearing wage.

Intuitively speaking, the idea is that if A has a right not to interact with B, and their interaction would be mutually beneficial, then it cannot be morally wrong for A to only pay B the wage that she can fetch on the market. For how can an act be better than a morally permissible alternative and yet itself be morally impermissible?

This is a powerful objection to the claim that it is wrong to pay sweatshop workers the market-clearing wage. How can defenders of that claim respond? One option is simply to deny the assumption that acts that are prudentially better than a morally permissible alternative are themselves morally permissible (Wertheimer 1996; Bailey 2011; Snyder 2009). Indeed, one might think that denying this assumption is not “puzzling” at all. To the contrary, it simply expresses the commonsense idea that by entering into certain relationships with other people we take on a special responsibility to treat them in a particular way. Philosophers call these “special relationships” and the corresponding obligations they generate “special obligations.”

By way of example, consider the following representative cases:

*Adoption:* I have a right not to adopt any children. But if I do decide to adopt one, then my relationship with that child should satisfy certain moral constraints. For example, I have an obligation to treat my adopted child fairly even if being adopted is better for my child than not being adopted at all.

*Marriage:* I have a right not to marry a particular man or woman. And he or she has a right not to marry me. But if we do decide to get married, then we should treat one another in a particular

way. I may not, for example, refuse to do my fair share of the household labor or expect my spouse to be the only one who is responsible for childcare even though it is better for them to be married to me than to not be married at all. (Wertheimer 1996: 290)

There thus seem to be many contexts in which special moral obligations are triggered by new interpersonal relationships. The only controversy is whether this characterizes the relationship between an employer and an employee.

Critics of the market-clearing wage believe that it does. Individuals, so the argument goes, have a right not to start a business. But if they do, then their relationship with their employees should satisfy certain moral constraints. Employers are, for example, morally obligated to pay their employees a nonexploitative wage. The problem with this response, however, is that defenders of the market-clearing wage can grant that special obligations exist in the above cases and yet deny that the same holds true for the relationship between an employer and employee. The employer-employee relationship is, after all, quite different from the parent-child or husband-wife relationship. Not only are the latter much more intimate, but they are also typically longer in duration. It is thus not sufficient for critics of the market-clearing wage to point to the existence of special obligations or relationships; in addition, they must explain why sweatshop owners have an obligation to pay sweatshop workers more than the market dictates even though they have a right not to transact with them in the first place. In the absence of such an explanation, the initial puzzle remains.

## Practical Implications

Suppose we assume for the sake of argument that sweatshop owners have a moral obligation to pay sweatshop workers a fair wage. Does it follow that they should also be *legally* obligated to do so? For example, should governments in the developing world mandate that employers pay their employees a living wage? Despite the intuitive

appeal of this suggestion, there are strong grounds for being skeptical.

The main difficulty is that from the fact something is immoral it does not necessarily follow that it should be legally prohibited. Lying is wrong, but intentionally making false statements should not be legally impermissible. By the same token, even if sweatshop owners have a moral obligation to pay sweatshop workers a living wage, that does not necessarily mean that the government should make this obligation legally enforceable. There are at least two reasons why the former might not entail the latter (Zwolinski 2007).

First, legally enforcing this obligation might have negative consequences. For example, many economists believe that adopting a government-mandated living wage would predictably lead to a loss in employment. But if that is the case, then adopting this policy would harm the very people it was meant to help. Second, legally enforcing this obligation might violate the autonomy of sweatshop workers. For if governments in the developing world prevented sweatshop workers from setting the terms of their employment in the manner they saw fit, then they would be interfering with a choice that is morally significant. And that would be disrespectful.

Both arguments can, however, be challenged (Kates 2015). On the one hand, even if the adoption of a government-mandated living wage leads to a loss in employment, it still does not necessarily follow that it should be rejected. Since virtually all social and economic policies have costs *and* benefits, the real question is which is greater. And so even if the adoption of a government-mandated living wage leads to a loss in employment, the benefits of such a policy might substantially outweigh the costs. On the other hand, one reason why sweatshop workers might be unable to make certain choices is that they face a collective action problem, that is, a situation in which there is a conflict between the interests of each sweatshop worker taken alone and the interests of the group or class of sweatshop workers taken as a whole. For example, sweatshop workers might want to collectively hold out for a living wage, but they each have an incentive to undercut their fellow workers. Under those circumstances, the only way

to put their choices into effect is via the coercive mechanism of the law. The upshot is that the answer to the question of whether developing countries should adopt a government-mandated living wage will depend on the situation. In some situations, such a policy will be warranted; in other situations, it will not be. It is thus not something that can be determined in advance of the facts.

## Summary

This entry has focused on the relationship between sweatshops and exploitation. To that end, it defined what a sweatshop is and explored the contrast between “macro-level” and “micro-level” accounts of exploitation. It then examined two different ways to flesh out the latter type of account: one based on the absolute standard of need and the other based on the comparative standard of fairness. Finally, it considered whether the market-clearing wage is wrongfully exploitative and, if so, what are the practical implications. In conclusion, it is safe to say that although there *is* disagreement about the question of whether sweatshop workers are exploited, there is *no* disagreement that this question matters.

## Taoism

Qinqin Zheng

Department of Business Administration, School of Management, Fudan University, Shanghai, China

## Synonyms

Chinese Yin-Yang philosophy

## Introduction

Taoism holds that Tao is inactive and natural. That is, Tao means the natural course, which is spontaneous, eternal, nameless, and indescribable. It is at once the beginning of all things and the way in which all things pursue their course. Founded by Laozi and Zhuangzi, Taoism is rooted in an understanding of the “way” (i.e., Tao), which is the shapeless force that brings all things into existence and then nurtures them. According to Laozi, the best way to govern is not to govern (i.e., wu wei). Tao has three aspects of meaning: first, Tao is the mixture of heaven and earth; second, Tao is the universal law existing in all things; third, Tao is invisible and has no image.

## Description

Tao manifests itself through natural principles or philosophies, including Yin-Yang duality, the

circular nature of changes, wu wei (the natural course of action), and harmony with internal and external environments (Barkema et al. 2015). *Tao Te Ching* is the first Taoist book of wisdom written by philosopher Laozi. In *Tao Te Ching*, Laozi established a philosophy centered on Tao. Unlike Confucianism, Taoism favors philosophical anarchism, pluralism, and laissez-faire government. Taoism embraces simple dialectical thinking and is an extremely important philosophical school among the “hundred schools of thought” in China. It has a huge impact on Chinese culture. Many Chinese and even foreign scholars have begun to notice and absorb the positive thinking associated with Taoism. It can be regarded as the center of the national thought, with a spirit of benevolence and knowledge.

Tao is embodied in the entire universe (the One); the universe is all about Yin-Yang (the Two); Yin-Yang nurtures heaven, the Earth, and humans (the Three); and heaven, the Earth, and humans together generate all things that should be harmonized (the All). The Yin-Yang philosophy is one of the central notions of Taoism, which teaches us how to act in accordance with nature:

- The Yin-Yang principle concerns complementary opposites – there is no life without death, no good without evil, no day without night. The normal operation of the universe needs all of these elements in order to be in equilibrium (Luo and Zheng 2016). Opposite elements will mutually transform into each other

in a process of balancing under various conditions. The Ying-Yang philosophy is deeply ingrained in East Asia. It holds that all universal phenomena are shaped by the integration of two opposite cosmic energies, namely, Yin and Yang. As shown by the Yin-Yang symbol (which has a white dot in the black area and a black dot in the white area), the spirit of this philosophy is the coexistence and unity of opposites to form the whole (Fang 2011). The Yin-Yang philosophy thus embodies duality, paradox, unity in diversity, change, and harmony, offering a holistic, dialectical view of the world. Yin and Yang coexist in everything while everything embraces Yin-Yang. Yin and Yang also give rise to, complement, and reinforce each other. Moreover, Yin and Yang exist within each other and interplay with each other to form a dynamic, paradoxical unity (Fang 2011).

- Although Yin-Yang principle is about the interdependence and transformation of opposites, Laozi did not suggest the struggle between opposites. He stressed “venerating softness.” Being gentle and flexible is more than a wise way. In other words, Laozi reveals the mutual transformation of opposites mainly to show that static can be transformed into dynamic, soft can be transformed into rigid, weak can be transformed into strong.
- The Yin-Yang philosophy takes a holistic, systematical view on the universe and all other systems, treating the universe as a whole rather than as a collection of individual parts. This discourse of the endless, circular, and transformative movement of change continues to influence people’s lives, including business life, in East Asia. This philosophy also proposes that the universe works harmoniously according to its own ways. When individuals exert their will against the world, they disrupt that harmony. Taoism does not identify one’s will as the root problem. Rather, it asserts that one must place one’s will in harmony with the natural universe. Taoists believe that opposite polarities, as noted in the Yin-Yang principle, are actually balanced and work together through cycles, thus creating a harmonious world.

Taoism advocates following the nature and praises the natural state of man and society. Some basic concepts of Taoism, such as pluralism and naturalism, are widely adopted in management. Many managers apply Taoist thought to organizational management. Contrary to the traditional management mode of attaching importance to rules and mechanism, Taoism encourages managers to pay more attention to employees and adopt people-centered management. It emphasizes people’s pursuit of freedom and equality. Taoism addresses that “everything has its own proper, and action should be taken in accordance with its nature.” The profound understanding of human nature provides the basic principles of Taoist management ethics.

Taoism is rich in dialectics, and one important perspective is to win the strong by the weak. Taoism had a deep understanding of the mutual transformation of opposites. Laozi suggested that “water may be the weakest thing in the world, but it may also beat a stronger one.” It inspires the disadvantaged groups to make possibly optimized choice by adopting flexible strategy of retreating in order to proceed and achieve final success.

The Taoist perceptions of compassion and interdependent causation also have great implications for leadership. Leaders are suggested to treat all employees equally. Meanwhile, different subordinates should be treated differently according to their specific characters. Taoist integrative thinking enables paradoxical leader behaviors, such as “maintaining both distance and closeness” and “maintaining decision control while allowing autonomy.” Accordingly, paradoxical leadership may positively affect employees’ job creativity and work outcomes (Zhang et al. 2015).

However, there are still some concerns on the defects of Taoism. For example, Taoism attaches enough attention to “Tao” (natural principles) but neglects “Shu” (tactics of techniques) (Li 2014). It may discourage managers’ active efforts to make changes. The overemphasis on “wu wei” may also hinder knowledge and technological progress. In addition, the implementation of Taoism is somehow difficult in business practice. In some situations, managers must take sides given opposite

options at hand. It is much easier to make dichotomies than to balance two extremes.

## Tax Compliance in a Voluntary Reporting Environment

Joanna L. Garcia  
Boler College of Business, John Carroll  
University, University Heights, OH, USA

## Synonyms

Tax evasion; Tax morale; Tax puzzle

## Introduction

In most developed countries, the income tax system uses a voluntary reporting process. This does not mean that the payment of taxes is voluntary but rather that the taxpayers determine and report their income and tax liability to the government. In contrast, sales, excise, and property taxes have tax bases that are predetermined, based either on purchases or an assigned value. The voluntary

nature of the income tax system provides opportunities for taxpayers to intentionally underreport their income or tax liability. This intentional underreporting is the source of the “tax gap” or the difference between taxes owed and taxes paid on time.

In the United States, the Internal Revenue Service (IRS) estimated that the average annual tax gap for 2008–2010 (the most recent available years studied) was \$458 billion. Audits and other enforcement activities recovered an additional \$52 billion, resulting in a net tax gap of \$406 billion. Based on IRS estimates of actual taxes owed, these gaps equate to a gross compliance rate of 81.7% and a net compliance rate of 83.7% (Internal Revenue Service 2018). The majority of the gap is caused by individual taxpayers underreporting their income, particularly business and self-employment income that is not easily verifiable by the IRS (The Tax Policy Center [n.d.](#)).

## Tax Compliance and Evasion

Though compliance rates vary across the world, all voluntary tax systems are affected by intentional underreporting or tax evasion. Government agencies employ a variety of strategies to ensure taxpayer compliance. These strategies are intended to both detect existing evasion and deter future evasion. Muehlbacher and Kirchler (2010) describe the “slippery slope” framework, which distinguishes between enforced and voluntary compliance. Enforced compliance is driven by the actual or perceived power of tax authorities, including the conduct of audits and assessment of penalties. Voluntary compliance arises from the trust taxpayers have for the authorities. This trust reflects taxpayers’ belief in the fairness of the tax system and tax authorities and can be fostered through establishing a “service and clients” attitude as opposed to a “cops and robbers” attitude (Kirchler et al. 2008).

Early theoretical research into taxpayer compliance employed traditional economic thought to model evasion as a function of the likelihood of detection and expected penalties if detected. Allingham and Sandmo (1972) were among the

first to model tax compliance and their approach-related tax evasion to the economics of criminal activity as well as the economics of uncertainty. They theorized that taxpayers would underreport income to maximize their after-tax income, given expectations of audit rates and penalties. They determined that increasing audit rates and/or penalties will always decrease tax evasion. Later researchers then tried to identify other factors that would affect tax evasion. Andreoni et al. (1998) note that, while prior studies show that evasion increases as income rises, there is mixed evidence as to the effect of rising tax rates. Demographic factors, including age, sex, and marital status, have also been shown to affect tax compliance.

To reduce tax evasion, tax authorities have traditionally focused on enforcement activities. As Allingham and Sandmo (1972) theorized, increased audit rates and penalties have been shown empirically to increase taxpayer compliance, but limited resources generally preclude high audit rates and necessitate adopting other strategies to increase compliance. These strategies, which may enhance Kirchler et al.'s (2008) trust relationship, include increasing taxpayer literacy, simplifying tax laws and administration, and improving taxpayer service (Kirchler et al. 2008). Additionally, many countries have instituted third party reporting of certain types of income, including wages, interest, and dividends. Easy (and often automated) detection of discrepancies makes it much harder to get away with underreporting these types of income. In the United States, the IRS estimates that, while 63% of income not subject to information reporting (e.g., sole proprietorship income) is underreported, only 7% of income subject to information reporting (e.g., interest and dividends) is underreported. Income subject to both information reporting and withholding (e.g., wages) is underreported by only 1% (Internal Revenue Service 2016). Audit targeting, which focuses on high-risk taxpayers (e.g., taxpayers with self-employment income or significant changes from prior year), can improve the efficiency of the audit process without increasing required resources.

## The Tax Puzzle

Early research focused on the gap in tax compliance, asking questions about why taxpayers underreported income and how to improve compliance. However, given typically low audit rates and penalties, these studies suggest that compliance rates are actually significantly higher than the models predict (Alm et al. 1999). The tax puzzle becomes not “why do taxpayers evade taxes?” but “why don’t taxpayers evade more taxes?” Subsequent research has sought new means of understanding taxpayer behavior, incorporating factors beyond strictly rational economic decision-making.

Alm et al. (1999) suggest that social norms play an important role in taxpayer behavior. Individuals will accurately report their income when they believe that compliance is the norm. Rampant noncompliance (real or perceived) will change the social norm, leading to even more evasion. They cite evidence that social norms of compliance vary across countries and that the variation relates to actual levels of compliance.

Another stream of research has investigated the psychological contract that exists between taxpayers and tax authorities. This contract contributes to tax morale, or taxpayers’ intrinsic motivation to be compliant. The contract implies that all parties have both rights and responsibilities (Feld and Frey 2007), including a commitment to treat each other with respect and honesty. “If tax administrations treat taxpayers as inferiors in a hierarchical relationship instead, the psychological tax contract is violated and citizens have good reason not to stick to their part of the contract and to evade taxes” (Feld and Frey 2007, p. 104). This contract also addresses the trade-off between taxes and public goods. Whether the taxpayer is a direct beneficiary or not, if they believe the political process is fair and that the government is using tax revenues effectively, they are more likely to feel the contract is being honored and to reciprocate with tax compliance.

A third approach to the tax puzzle considers the effect of ethics on tax morale and compliance. Alm and Torgler (2011) argue that it is impossible to fully understand an individual’s decisions,

including tax compliance decisions, without considering the influence of ethics on their behavior. This goes beyond the idea of the social norm or psychological contract, in creating an expectation that taxpayers will fully pay their taxes because it is the right thing to do, regardless of what others are doing or how they are personally benefitting from taxpayer-funded government action. That said, taxpayer ethics may still be eroded by the actions of the tax authority, but individual ethics are perhaps more resilient to external influences than other forces driving tax compliance.

## Conclusion

Tax compliance is a complex set of behaviors with a multitude of influential factors. While it is not yet fully understood, researchers have identified several strategies for both improving and diminishing compliance. From a tax administration perspective, a multifaceted approach is likely most effective at reducing the tax gap. This approach could include extrinsic motivations such as audits and penalties, as well as other policies intended to appeal to taxpayers intrinsically, including enhanced customer service, openness and fair dealing, and appeals to taxpayers' sense of ethics and morality.

## Tax Havens

Alex C. Michalos  
University of Northern British Columbia,  
Ottawa, ON, Canada

## Synonyms

Financial hiding places; Havens of law evasion; Offshore areas of rules and regulations evasion; Offshore banking; Secrecy jurisdiction; Tax avoidance; Tax evasion

## Definition

A tax haven “is a place that seeks to attract money by offering politically stable facilities to help people or entities get around the rules, laws, and regulations of jurisdictions elsewhere” (Shaxson 2011, p. 11).

## Description

In his provocative classic, Shaxson (2011, p. 33) claimed that “Tax is the missing element in the corporate social responsibility debate.” While it is true that investigations of taxes appear relatively

infrequently in the literature of business ethics or corporate responsibility, investigations of tax havens appear even less frequently (Michalos and Poff 2012). The term “tax haven” usually evokes the vision of a tropical island speckled with a variety of financial institutions and populated with service providers making a healthy living within or at least because of those institutions. Shaxson (2011, p. 24) quoted an expert in the field saying “It does not surprise anyone when I tell them that the most important tax haven in the world is an island, . . . . They are surprised, however, when I tell them that the name of the island is Manhattan. Moreover, the second most important tax haven in the world is located on an island. It is a city called London in the United Kingdom”. Because offshore tax havens have proved successful at attracting money from onshore operations, many of the tactics used in offshore operations have become onshore operations too. For a rather late example, Deneault (2015, p. 193) claimed that as of 2006, “A company opening in Halifax, Nova Scotia could now count on bargain-rate, qualified middle-class employees who would carry out operations according to Bermudian law without having to be housed in Bermuda.”

Shaxson’s broad definition of tax havens provided above does not mention taxes because the “rules, laws, and regulations” that are bent or broken do not always involve taxes, e.g., the free-trade zone *maquiladoras* in Northern Mexico involved measures with special provisions for worker and environmental protection that shielded company owners from standard regulations (Michalos 2008, pp. 30–62. See also Deneault 2015, pp. 48–49). According to a report from the OECD (1998), tax havens “erode the tax bases of other countries, distort trade and investment patterns and undermine the fairness, neutrality and broad social acceptance of tax systems generally.” In all cases the term “tax haven” refers to a jurisdiction with laws or regulations that legalize agents’ ability to take a free ride on public and/or private operators in some other jurisdiction(s). The material value of the free ride is usually much greater than the value of the low corporate taxes, local employees’ income taxes,

and assorted fees earned by the havens. The operating “offshore principle in its purest form,” Deneault (2015, p. 107) wrote, “as long as you don’t plunder us directly, we’ll allow you to deposit with us the booty you acquired through plundering or embezzlement somewhere else.”

Shaxson (2011, pp. 12–13) lists at least seven characteristics to help people identify tax havens. Briefly, they are political jurisdictions that (1) offer secrecy for financial transactions to individual or corporate agents and (2) “very low or zero taxes” and (3) have relatively “large financial services industries” compared to the size of the local economy and (4) provisions protecting operators in the local economy from the “offshore tricks” they offer to nonresidents. (5) Their “local politics is captured by financial interests from elsewhere [i.e., banks, law firms, accountants, and auditors],” and (6) local residents “usually deny” that they engage in offshore trickery. Worst of all, perhaps, (7) “The offshore world is steeped in a pervasive inverted morality: Turning a blind eye to crime and corruption has become good business practice: a way of attracting money; while alerting forces of law and order to wrong doing has become the punishable offence.”

Thirteen years before Shaxson’s criteria for identifying a jurisdiction as a tax haven were articulated, the OECD suggested a set of four criteria. In the Organization’s view at that time, tax havens are jurisdictions with (1) no or only nominal taxes, (2) lacking effective exchanges of information and (3) transparency, and (4) having no substantial activities (paraphrasing OECD (1998, p. 23) as reported by Preuss (2012, p. 2). The most comprehensive set of criteria have been specified by the Tax Justice Network described in Michalos (2019).

While Shaxson emphasizes the central role played by financial intermediaries, he also recognizes that “nearly every multinational corporation uses tax havens” (Shaxson 2011, p. 11). Phillips et al. (2017, pp. 1–3) reported that “At least 366 companies, or 73 percent of the Fortune 500, operate one or more subsidiaries in tax haven countries. All told, these 366 companies maintain at least 9,755 tax haven subsidiaries. . . . Fortune 500 companies are holding

more than \$2.6 trillion in accumulated profits offshore for tax purposes. Just four of these companies, Apple, Pfizer, Microsoft and General Electric, account for a quarter of the total... Goldman Sachs reports having 905 subsidiaries in offshore tax havens, 511 of which are in the Cayman Islands, despite not operating a single office in that country.”

The array of tricks employed to avoid (which is legal) or evade (which is illegal) taxes, laws, and regulations varies from the familiar and easy to understand to the unfamiliar and difficult to understand. In the previous paragraph, I mentioned the special provisions in free-trade zones shielding owners from standard worker and environmental protection regulations. Probably the most familiar trick involves a company securing the status of a legal entity or legal person through incorporation in a jurisdiction (country, state, territory) with low or even zero levels of some sort of tax, e.g., state income tax, asset/wealth tax, sales tax, stock transfer tax, financial transactions tax, or inheritance tax. Depending on the levels of financial secrecy in the jurisdictions involved, assets and income coming from them may not even be known to other jurisdictions. The head offices of such companies are usually located in a different jurisdiction.

When a company reincorporates itself so that a division that was initially a subsidiary in a different country becomes the parent company and the original company becomes the subsidiary, the reversal of roles is referred to as an inversion or expatriation, e.g., an American company with a subsidiary in the British Virgin Islands might reincorporate itself in the latter jurisdiction, effectively becoming a British company with a subsidiary in the USA. The headquarters, personnel, and primary functions of the company might remain exactly as they were before the inversion or expatriation (Godar et al. 2005). A substantial literature has emerged in the field of business ethics concerning the legitimacy of inversion or expatriation. Johnson and Holub (2003, p. 269) reported that in the USA, concerns were raised by:

...U.S. media, ordinary taxpayers, shareholders and politicians... about the reduction of the tax base and the lack of oversight and regulation in offshore centres. Offshore reincorporation has been condemned as immoral, unconscionable, dishonest and unpatriotic, accusations that cast doubt on the legitimacy of the companies concerned. In question is their right to conduct business in the U.S. and in particular, their right to still be viewed as American.

In the view of critics of inversion or expatriation, incorporation is based on a social contract in which the citizens of a jurisdiction grant citizenship to a company on condition that the company fulfils “the needs of society and the benefits accruing to society from their existence exceed their costs” (Johnson and Holub 2003, p. 270). Companies taking a free ride on the taxpayers of other citizens in their jurisdiction are not carrying out their obligations specified in the social contract.

According to Shaxson (2011, pp. 123–125), “over half of U.S. publicly traded companies and nearly two-thirds of its Fortune 500” are incorporated in Delaware, the country’s second smallest state. Granting some tax advantages, Shaxson claims that the main advantages the state offers are its “laissez-faire standards of corporate governance,” i.e., the very business-friendly approach taken by its legislators and courts. (This feature is also one of the main attractions of international trade agreements (e.g., the North American Free Trade Agreement (NAFTA) and commercial arbitrators (Michalos 2008, pp. 188–189).) Replying to a critical remark by President Obama about the fact that over 12,000 corporations were housed in one building in the Cayman Islands (the real number was over 18,000), the chairman of the Cayman Islands Financial Services Authority said one building in Wilmington, Delaware, housed 217,000 companies (Shaxson 2011, p. 125).

Another somewhat familiar trick is called “transfer pricing” (in fact, fake pricing) in which a company shifts “profits offshore, where they pay little or no tax, and shifts the costs onshore, where they are deducted against tax” (Shaxson 2011, p. 14). Transfer pricing is contrasted with arm’s length pricing recommended by the OECD and

codified in laws in several countries. Arm's length pricing "states that intra-firm transactions should be priced as if they were with independent parties transacting in the open market" (Mehafdi 2000, p. 368). With transfer pricing a multinational company with subsidiaries in many countries might locate different aspects of its business in different countries, e.g., with company incorporation in one country, a head office in another country, sourcing input materials from other countries, actual production of its products in still other countries, and marketing, shipping, financial, and insurance services in yet more countries. A holding company might be created to draw several independent companies together and create opportunities for transfer pricing. The more subsidiaries a company has, the more opportunities it has to raise, lower, and move costs and benefits around to maximize its overall profits. Following Christensen and Murphy (2004), Preuss (2012, p. 3) reported that Enron "applied an elaborate tax avoidance strategy through a total of 881 offshore subsidiaries, of which 692 were incorporated in the Cayman Islands."

Summarizing his views on transfer pricing, Mehafdi (2000, p. 373) wrote:

In the realm of business ethics, there is no place for dubious TP practices, whether they are market or cost based and whether they disadvantage an internal customer or a host government. Existing research reveals that TP systems do not always receive unanimous acclaim as divisional managers overtly express dissatisfaction or conflict with prevalent policies. . . managers' behaviour reflects perceived financial harm on their divisional results.

To assist companies in creating additional subsidiaries at a very low cost, shell or shelf companies might be established offshore. Shell companies (also called "special-purpose vehicles") are typically inactive establishments that might not even have an office or employee or might have a single director who often serves as a director for hundreds of other shell companies operating out of one office. For example:

Mining corporations defined as 'Canadian' often do not have any substantial activity in Canada: many of them originate in other countries and operate mines in countries other than Canada. They are incorporated in Canada in order to benefit from the

regulatory, legal, and tax advantages provided here. . . These companies work mining claims obtained in Ecuador, Chile, Zambia, Haiti, Burkina Faso, Indonesia, Romania, or elsewhere. Close to half the mining projects registered on the TSX [Toronto Stock Exchange] are located outside of Canada, and many companies registered in Canada do not have a single claim on Canadian soil. (Deneault 2015, p. 158)

Shelf or vintage companies are basically shell companies that have been set up and maintained for some time to be sold to anyone interested in establishing a company relatively quickly that has the appearance of longevity. Shaxson (2011, p. 122) has a memorable example of a Wyoming website selling shelf corporations in which the purchaser's name is "on nothing"; the "companies already exist and are complete with Articles, Federal Tax ID numbers and registered agents"; and the companies are available "by tomorrow morning . . . for \$69, plus modest state filing fees."

Many of the benefits of special laws and regulations can be obtained from trust accounts. A standard trust account has three elements, a donor who is supposed to give away some asset, a trustee who is supposed to become the legal owner of the asset, and a beneficiary who is supposed to enjoy the benefits of the asset. For example, a parent may establish a trust of \$10,000 for his or her child, with some apparently reliable person serving as the trustee and the child serving as the beneficiary, with benefits accruing to the child in the form of the original lump sum or the total flow of income from investments of the money as determined by the trustee. With blind trusts of the sort typically arranged by politicians for the duration of their terms in office, the politician is supposed to assign legal ownership of his or her properties earning financial returns to trustees without knowledge of their performance, but he or she is allowed to terminate the arrangement at any time.

Standard trusts are legal but provide many opportunities for avoiding and evading laws and regulations. There are also a variety of forms of trust in the same and different jurisdictions, with a variety of laws and regulations applying to them, which provide many more opportunities for avoiding and evading other laws and regulations.

It is possible, for example, for a donor to establish a trust that appears to give away ownership of some asset to a trustee although the donor really enjoys remaining as the beneficiary. The general strategy involves violating a trust's basic suppositions regarding the nature of the relationships and activities of each of its three elements. Some jurisdictions allow donors to have discretionary authority to determine a trust's investments; to replace a trustee "with a more pliable trustee, or even by the [donor] . . . in disguise"; to "amend or revoke the terms of a trust"; to "claim the property back [creating a 'revocable trust']"; to serve as the trustee and the beneficiary (or even as the donor, trustee, and beneficiary (Deneault 2015, p. 83)); to "appoint a Private Trust Company (PTC) as the trustee"; and then to take control of the PTC as a director. Some jurisdictions allow trustees to make investments and income payments that may not be in the best interests of the beneficiary, and the beneficiary has no right to appeal. Some jurisdictions allow trust deeds to include "flee clauses" that trigger jurisdiction changes for a trust as soon as significant enquiries are made about it. On top of all these avenues for avoiding or evading some jurisdiction's laws and regulations, it is possible to "ladder" trusts and shell companies such that the beneficiary of one trust is another trust or shell. Net income from the first trust is passed on to the second trust or shell, and what is passed on is tax deductible from the first trust. Net income from the second trust is passed on to a third and so on until the ladder is long enough to reduce taxable trust income to zero on the last trust. The trick only works if the expenses at each step of the ladder are adequate, which might require illegally cooking the books. Supposing the trustees involved in a ladder of trusts are unwilling to cook the books, they might still avoid or evade taxes by making the ladder long enough across enough jurisdictions that few inspectors would be willing and able to examine the total lot to determine the trusts' appropriate taxes due (Tax Justice Network 2009).

Trusts and shell companies are also used for laundering money obtained from illegal activities (dirty money) to give it the appearance of money obtained from legal activities (clean money). The

trick may be performed in a number of ways, e.g., smuggling dirty money as cash into banks or other financial institutions in tax havens, dividing large amounts of money into many smaller amounts such that transactions with those amounts would be unnoticed by financial inspectors, altering invoices to show transfers smaller or bigger than those actually made, mixing dirty money with cash deposits made by cash-intensive businesses (check-cashing services, nightclubs, or car washes), establishing banks or other financial institutions to provide user-friendly outlets for dirty money, purchasing real estate with dirty money and then selling it to obtain clean money, and buying casino chips with dirty money and cashing them in to obtain clean money (Legal Dictionary (2019)). Dirty money can also be used to purchase bearer bonds (i.e., anonymous bonds not containing an owner's name) that can be traded for clean money or shares in companies. If a shell company issues a single bearer share, then whoever owns that share owns the company anonymously.

According to Shaxson (2011, p. 23), the "off-shore world" is a set of "networks of influence controlled by the world's major powers, notably Britain, the United States, and some jurisdictions in Europe." Regarding Britain, he wrote:

When Britain's formal empire collapsed, it did not entirely disappear. Fourteen small island states decided not to become independent and became instead Britain's Overseas Territories, with Britain's Queen as their head of state. It is a status that has been preserved until today. Exactly half of them – Anguilla, Bermuda, the British Virgin Islands, the Cayman Islands, Gibraltar, Montserrat, and the Turks and Caicos Islands – are tax havens, actively supported and managed from Britain and intimately linked to the City of London. Accompanying these were the Crown Dependencies near the British mainland – Jersey and Guernsey, in the English Channel off the French coast; the Isle of Man, near the Irish republic; as well as a scattering of other territories – Hong Kong as a gateway to China. . . and a variety of ex-colonial oddities in the Pacific and elsewhere. (Shaxson 2011, pp. 87–88)

Other jurisdictions in the British Commonwealth Realm include St. Kitts and Nevis, the Bahamas, Antigua and Barbuda, Barbados, Belize, and St. Vincent and Grenadines. While

other countries have diverse connections to other territories, “jurisdictions that are formally or informally dependent on Britain clearly play in their own league” (Fichtner 2014, p. 48).

Examining “global corporate ownership networks,” Garcia-Bernardo, Fichtner, Takes, and Heemskerk (2017) distinguished “sink” jurisdictions “that attract and retain foreign capital” from “conduit” jurisdictions that mainly facilitate “the transfer of capital to other countries.” Five countries serve mainly as “conduits,” the Netherlands (by a wide margin), the United Kingdom, Switzerland, Singapore, and Ireland, and twenty-four jurisdictions serve mainly as “sinks.” The top five “sinks” are the British Virgin Islands (by a wide margin), Taiwan, Jersey, Bermuda, and the Cayman Islands. Using their network analyses, these authors were able to reveal geographical and sectoral specializations among secrecy jurisdictions that cannot be revealed by “offshore-intensity ratios” or “ratios of foreign investment to GDP.” These authors remind us of the difficulties of sorting out which jurisdictions have exactly what financial wealth. In fact, all the writers consulted have emphasized that their findings most likely represent an underestimate of actual holdings and transfers. The following comment by Zucman (2015, p. 35) precisely illustrates the sort of problems faced by researchers in this field – “Remember...that the distinction between Switzerland and other tax havens doesn’t really make much sense: a large part of the assets registered in Singapore or Hong Kong are in reality managed by Swiss banks, sometimes directly from Zurich and Geneva.”

According to Zucman (2015, p. 45), “It is one of the great rules of capitalism that the higher one rises on the ladder of wealth, the greater the share of financial securities in one’s portfolio.” Financial securities include bank deposits, stocks, bonds, shares of mutual funds, and insurance contracts. Net household wealth is the sum of such securities plus nonfinancial wealth in the form of material goods like real estate, art, jewelry, and gold, minus any debt. Zucman (2013) estimated that 8% of the world’s household financial wealth (10% of world GDP) is held in offshore tax havens. Using 2007 as the “benchmark” year for

their assessments, Alstadsaeter, Johannesen, and Zucman (2017) offered, for the first time ever, country-by-country estimates of this wealth (\$5.6 trillion). Besides having about 45–50% of the globe’s offshore wealth in 2006–2007, Switzerland also has relatively good official banking and financial institution data. Extremely briefly then, these authors estimated “how much each country owns in Switzerland, then . . . how much each country owns in tax havens other than Switzerland, and last combined the two distributions.” Shaxson (2011, pp. 29, 139) noted that according to a 2011 report from the Global Financial Integrity Program in Washington, for every dollar that was legally transferred from a developed to a developing country in 2008, ten dollars was illegally transferred back from a developing to a developed country. Presumably, Switzerland was the recipient developed country almost half the time.

Shaxson (2011, pp. 171–192) has a whole chapter with anecdotal evidence of some unfortunate consequences for the quality of life in the small island communities of the Cayman Islands and Jersey with a “pervasive inverted morality.” Regarding his investigations in the Cayman Islands, Shaxson (2011, p. 177) reported that when he “asked questions such as whether or not one might balance the prosperity of the fifty thousand—odd islanders against the interests of 350 million North Americans, 600 million Latin Americans, and the same number again in Africa,” respondents “seemed to find it distasteful, or changed the subject.” Residents engage in “self-censorship” lest they reveal or discover undesirable features of themselves and their neighbors. Remarkably, one respondent claimed that “a few people here—those people who have committed what the international community would consider unlawful acts—they get the CBEs, the OBEs [British royal decorations] . . . they sit on boards, they have high status, and they are looked upon as statesmen” (Shaxson 2011, p. 179). In the banking and financial services industry, there is relatively high staff turnover, highest for the most curious staff members. “In the British tax haven of Jersey,” he wrote, “three local sayings encapsulate the constant

social pressure: ‘Don’t hang your dirty linen out in public,’ ‘Don’t rock the boat,’ and ‘If you don’t like it, there’s always a boat in the morning.’”

Offshore attitudes are characterized by amazing similarities, of approach, and of method, and some striking psychological affinities, in a geographically diverse but like-minded global cultural community offshore... And these attitudes fit seamlessly with ... a libertarian, leave-us-alone worldview... [that] dovetails closely with offshore’s ethical framework, which hold the rights even contemptful citizens and governments elsewhere to be inconsequential, which sees democracy as a ‘tyranny of the masses,’ and holds the very idea of society with disregard, ”... In Jersey there are no credible and truly independent processes for internally scrutinizing or regulating offshore finance... ‘Jersey has the social structure of a Hilton hotel,’ explained Jerry Dorey, a Jersey senator. It contains ‘a collection of alienated individuals who are just here to make money’.

(Shaxson 2011, pp. 185)

Quite generally, Deneault (2015, p. 264) claimed that while “a number of liberal-minded thinkers entertain the delusion that becoming a tax haven is a form of *development* for poor countries, ... the offshorization of small states is known to be a curse. In almost every case, populations of the South become poorer when their state transforms tax systems and investment rules to suit the needs of corporate capital. As their personal situation deteriorates, island populations see billions flying around above their heads.”

Michalos and Hatch (2019) provided the first comprehensive look at the association of financial secrecy and quality of life measures in 105 countries for 2015. While they did find a negative correlation between these measures, Switzerland generally had the highest quality of life scores and the greatest financial secrecy scores, uncharacteristically compared to the group as a whole.

## Tax Justice Network

Alex C. Michalos  
University of Northern British Columbia,  
Ottawa, ON, Canada

### Synonyms

Coalition on tax justice; International tax coalition; Online tax justice; Tax fairness network; Tax fairness organization; TJN; Virtual tax justice organization

### Definition/Introduction

This is a description of an international virtual online network of scholars, experts, and ordinary citizens concerned with tax fairness, especially the negative impact of tax havens or financial secrecy jurisdictions on tax fairness and lost government revenue.

### Description

According to the website of Tax Justice Network (TJN), the organization is “an independent international network launched in 2003...dedicated to high-level research, analysis and advocacy in the area of international tax and the international aspects of financial regulation.” Members of the group “map, analyze and explain the role of tax and the harmful impacts of tax evasion, tax avoidance, tax competition and tax havens,” with special attention given to “the world of tax havens” (Meinzer 2016) or financial secrecy jurisdictions.

While the TJN undertakes analysis and reporting, its sister organization “the Global Alliance for Tax Justice (GATJ)” specializes in

overt political action, campaigning for concrete changes to tax policies around the world. The TJN tries to “incubate new projects” and build related activist communities in support of those projects, allowing members of TJN to break new ground in different areas. New projects have included developing the biennial Financial Secrecy Index in 2009 (Tax Justice Network 2016a, b), a movement pushing for country-by-country reporting of companies’ taxable activities (Meinzer 2012), a financial journalism training program, a “tax haven-focused alternative to traditional views of corruption,” “dirty money in sport,” “tax justice through human rights,” tax competitiveness, and a “tax justice world view which essentially forms a new prism for understanding financial globalization in all its forms.”

Besides providing research and analysis of tax-related matters, the TJN produces the newsletter Tax Justice Focus and the monthly Taxcasts; organizes workshops and conferences; produces articles, blogs, and books (e.g., Shaxson 2011); and works with network partners around the world, e.g., the GATJ, the Independent Commission for the Reform of International Corporate Taxation, and the Financial Transparency Coalition. Regional partners include TJN Africa, Asian Tax Justice Alliance, TJN Nordics, Eurodad, TJN Latin America, and North America, and there are several country-specific TJNs, e.g., in Australia, Austria, Bangladesh, Canada, etc.

## Teaching Business Ethics

Alex C. Michalos<sup>1</sup> and Deborah C. Poff<sup>2,3</sup>

<sup>1</sup>University of Northern British Columbia, Ottawa, ON, Canada

<sup>2</sup>Leading with Integrity, Ottawa, ON, Canada

<sup>3</sup>Brandon University, Ottawa, ON, Canada

### Synonyms

Business ethics education; Business ethics teaching; Journal on teaching social responsibility of business; Teachers' journal on business ethics

### Definition

This is a brief account of the first journal published that was devoted to the teaching of business ethics or socially responsible business.

### Description

The first issue of *Teaching Business Ethics* (tbe) appeared in July, 1997, 109 pages of 453 for the full volume. Its basic aim and scope was described

by its coeditors Alex C. Michalos and Deborah C. Poff as “an interdisciplinary quarterly journal designed to provide a public forum for teachers and academic researchers in the field of business ethics to exchange views about substantive and methodological issues related to teaching business ethics. Unlike all other scholarly journals devoted to the study of business ethics, the focus of *Teaching Business Ethics* is on the practice of teaching the subject” (Michalos and Poff 1997).

The idea for the journal occurred to Michalos and Poff after some years observing that in this field, as in most others in the academy, there were some scholars primarily interested in developing the next generation of citizens in general and, in this case, businesspeople in particular, and some were primarily interested in searching the field for new facts, lawlike regularities and theories. While it is at best an open question if this rough division of labor in the academy is the most effective and efficient means to learning and appreciating any subject matter as well as producing morally good practitioners of any sort, the division exists and must be managed somehow. The founders of this journal hoped that by providing dedicated space to scholars with different primary interests, comforting networks would be created that eventually would build mutually beneficial bridges for more robust development of all concerned. Representatives of Kluwer Academic Publishers shared the founders vision and agreed to produce the journal.

The seven volumes of *Teaching Business Ethics* appeared from July 1997 to November 2003. By then it had generated 28 issues and 242 articles. Copy flow and sales were relatively slow and it became commercially unsustainable. However, there seemed to be enough interest in the field to introduce a section of the *Journal of Business Ethics* devoted to teaching business ethics. That section was opened with the closing of the and it has remained active to this time, 2017.

Relational ethics

## Introduction

Some worthwhile goals require people to work together to achieve them. When a group of people who have complementary skills and knowledge work together toward such a common goal, they are often referred to as a team. Members of teams hold one another mutually accountable for doing what it takes to achieve the goal. Team sizes may differ but, given the unwieldiness of a large number of people working together in practice, when people talk of teams, they are usually speaking of groups of less than 20 people. Strictly speaking, however, there are no limits to team numbers. A large corporation employing thousands of people could still claim to work as a team or with team spirit.

Sometimes, team members have some input in the selection of their co-workers, but, at other times, they are “forced” together. In either case, teaming requires trust and integrity. In other words, if the people are to work well together, it requires ethics. Reference points for the required

ethics are partially norms influencing the team from outside it and partially norms generated within the team. From within the team, each team member needs to comply by certain rules agreed on as a team. Even when such rules are not, strictly speaking, concerned with matters of ethical behavior, team members who have agreed to team rules would be acting unethically if they were to disregard them later on. From outside the team, sources for team ethics include ethical codes laid down by institutions larger than the team (profession, company, industry, and country) and the personal values of individual team members. These are discussed below.

## Ethics and Conduct: Intra-team Rules

In order to achieve the team’s goal, it is helpful for its members to be guided by some rules which help them to maintain ethical behavior among themselves. The practice of these rules is often expressed in form of good habits or virtues that contribute both to the flourishing of team members as individuals and to them taking seriously their responsibility for achieving the purpose of the team. In order to make the rules clearer for everyone, the team could, formally or informally, draw up a code of ethics for itself and incorporate various agreements into it. It is important to note that if the team’s purpose were unethical, then this would taint the intra-team rules which would then become means to do something bad. For intra-team rules to be truly good, the purpose of the team must be ethical. For example, except in an abstract way, one could not admire members of a gang of robbers for following team rules.

## Team Ethics Expressed Through Virtues

As the team develops – forms, storms, norms, performs, and adjourns according to Tuckman and Jensen (1977)’s small group development model – each member is called on to practice enabling habits that make it easier to accomplish the team’s goals. Typical team activities require communication (listening, speaking, writing including via social media, etc.), joint decision-making, collaboration, self-management, and

emotional intelligence, among others. Certain good human habits facilitate these activities, while bad habits impede them and can end up defeating the purpose of the team and frustrating its members. For example, it would be difficult for a person who is habitually selfish to consistently cooperate with the rest of the team, or to participate when he or she could get away with freeriding, or to assist others when such help is not compulsory. Good human habits, also known as virtues, which enable ethics within teams include patience, generosity, solidarity, loyalty, diligence, honesty, and diligence.

### **Responsibility Within the Team**

Everyone in the team must accept responsibility for the overall outcomes irrespective of the personal or group perception of the importance of their role. In order to make it easier for the team's goal to be achieved, responsibilities are usually distributed in the form of tasks. Apart from the set tasks, teams usually expect their members to go out of their way to do what the team needs, outside their set responsibilities. For example, a member of a team who accidentally discovers that tickets are being offered at a discount for an event that the team needs to attend would be expected to attempt to purchase the discounted tickets for the team which could then reimburse him or her later. Such behavior is at times called responsible citizenship behavior (RCB). RCB within the team could include readiness to step up when a task needs to be done and to step in whenever there is a gap because someone else could not manage to do something. It could also include protecting the interests of the team even when not strictly required to do so.

### **Drawing Up a Code of Ethics for the Team**

It would be useful for the team to clearly distribute tasks and set ground rules for their work together. When the team has agreed to certain rules, it would be unethical for one team member to unilaterally disregard them except in extenuating circumstances. Disregarding jointly agreed team rules often entails a lack of virtue. Thus, for example, even though the time to arrive at an event ordinarily depends on the individual, once the person has agreed with his or her team to attend

to an assignment by a certain time, it would be unethical to default since it would be a lack of responsibility and loyalty. Similarly, it might not matter if someone preferred to provide services on credit in a personal undertaking. However, if and when a team has decided that full payment must be made by clients before services are provided, members should try to keep to the agreement as a matter of fairness and respect to one another. Setting ground rules for the team beforehand helps the team to work more smoothly since it makes it easier for everyone to have some common behavioral standards and expectations. Some examples of what such rules could be are mentioned below.

Team rules could include agreements for all members to commit to the team's goals; perform assigned tasks completely, accurately, and on time; respect others' contributions; be honest with the rest of the team, including avoiding deception; avoid creating or prolonging drama; assist other team members when needed; ask for help in time rather than at the last minute, if possible; contribute to making meetings effective; promote harmony in the team and solve problems openly and sincerely; share all relevant information, e.g., changes in schedule; focus on problems and not on people; constructively resolve conflicts or differences of opinion; comment clearly, respectfully, and constructively on others' contributions; respect individual differences (ethnicity, race, age, religion, gender, marital status, experience, etc.); respect others through personal grooming and care for joint spaces, e.g., bathrooms, kitchenettes, and sitting areas; respect privacy of other team members and confidentiality; and protect the team reputation including in social media. The team should also pre-agree on guidelines with regard to ethical issues, including enforcement (how to check or assure compliance with the rules). Having rules such as these does not make them easier to comply with. However, it helps everyone to be aware from the outset of the need to adhere to some codes of behavior in order to work well together and achieve the goal for which the team was created. It also makes it easier to identify and correct deviant behavior within the team.

## Ethics and Conduct: Extra-team Rules

Since the team is part of a larger society, it is affected by ethical norms that come from outside itself. Part of the test of whether the team's purpose is ethical is the extent to which it aligns with such norms. Thus, for example, a team formed in order to smuggle contraband into their country has an illegal purpose, and its actions are unethical. Sources of guidance for ethical norms that guide the team include professional associations, companies (if the teams are within them), and government legislation. These are discussed briefly below. In addition, external influences on team ethics include associations, such as religion and the family, which have the potential to shape members' personal values in a positive way so that they more easily act virtuously. When one has the option to choose his or her team members, looking out for people who try to act habitually in virtuous and responsible ways can help to lay a good foundation for an ethical team.

### Professional Codes

Different professions at times have laid down guiding rules of ethics and conduct for their members. These rules are usually compiled by respected members of that profession and taught to and accepted by all who enter the profession. Thus, for example, doctors, lawyers, engineers, and hairdressers might have codes for their professions. In general, professionals (and therefore teams of professionals) are expected to:

1. Use their expertise to enhance human flourishing rather than to harm it, e.g., a pharmacist should not use his or her knowledge of poisons to supply it to would-be murderers. This also means that they should give priority to public safety, health, and welfare in the course of their professional work, e.g., an engineer should insist on safe construction materials even if this is more expensive. In the same vein, they should continue developing themselves and their supervisees professionally, e.g., teachers should do this in order to be always up to date and thus deliver valuable teaching to the learners entrusted to them.
2. Perform services only in the fields where they are competent, e.g., a doctor should not pretend to be a bricklayer, and a bricklayer should not masquerade as a doctor. They should not take on responsibilities in aspects where they are not qualified or have less than adequate knowledge and skill, e.g., not every doctor is a surgeon.
3. Be honest, impartial, and loyal in serving society, their employers, clients/customers, and suppliers. In this list, the common good comes first – The good of society in line with what is truly good for human flourishing, e.g., a lawyer should be loyal to his client insofar as this aligns to his loyalty to his employer law firm, provided that the law firm does not require him to be disloyal to the good of society. For example, a law firm that has a culture of dishonesty loses the right to loyalty from its employees since dishonesty is contrary to the good of society. Ideally, in such a case, they should try to change such a culture or leave the firm to find work elsewhere.
4. Act with integrity when employed, and avoid conflicts of interest, e.g., a judge should not take a bribe from someone who has a case in his or her court. In turn, they should refrain from underhand gestures (bribes, gifts, discounts, etc.) meant to influence the client's decisions in their favor. A team of architects should not bribe decision-makers at client companies in order to have contracts awarded to them rather than to other competitors. They should build their reputation on the merit of their services and not compete unfairly with others, e.g., in some professions, advertising is not allowed, while in others, advertisements are not expected to denigrate the competition.
5. Associate only with reputable persons or organizations, e.g., a professional found to be associated with a gang of kidnappers or with an outfit trading on insider knowledge could bring disgrace on self and on the profession.
6. Issue public statements objectively and truthfully, e.g., a statement issued publicly by any professional as a professional should be reliable; for example, professionals are sometimes

called as expert witnesses in court or quoted in the media.

7. Consider social and environmental impact in the performance of their professional duties, e.g., a team of urban planners and builders should consider the impact on the nearby water sources and the people dependent on them when specifying the positioning or extension of a city's drainage.

These are some of the expectations that a team would legitimately have from each professional within the team and, in turn, the expectations of good behavior that society would have from a team of professionals. If there is one person within the team that infringes the codes of his or her profession, the ethical rating and reputation of the whole team are endangered, and the others have a duty to call the person to order and help him or her rectify the problem.

### Core Values and Codes in Institutions

Companies usually have institutional codes that apply to all their employees in order to promote and to enforce ethical behavior. These may be called codes of ethics or codes of conduct. Some companies have both, either separate or combined under either name. Scholars tend to associate code of ethics with the promotion of moral values and code of conduct with the enforcement of moral behavior. In general, codes should seek to:

1. Set out clearly what the ethical standards of the organization are for the employees, e.g., at times these are primarily and summarily conceptualized as a few core values to which the whole of the code is then aligned.
2. Clarify gray areas such as acceptance or giving of gifts and other potential conflicts of interest situations.
3. Communicate sanctions for unethical behavior.
4. Indicate channels for reporting unethical behavior, e.g., a whistle-blowing ombudsman.

Teams formed within the organization or across organizations are required to respect the codes of the organization with regard to ethical behavior. If the team within an ethical

organization acts unethically, someone within the team should have the moral courage to blow the whistle and report this behavior to the appropriate authorities in the company.

### State Laws and Industry Regulations

Society is usually protected by laws in order to ensure the good behavior of all citizens as much as possible and promote the common good. Since companies and teams are part of society, they are also bound by these laws. It could happen in relatively rare occasions that a person or a team could be justified in resisting an unjust law. However, ordinarily, assuming that legislation is just, everyone is expected to obey the laws of the state, region, country, or other geographical location in which they reside or operate. Also, in order to protect society, some industries are regulated by laws specifically addressed to those industries, for example, the food and drug industry has regulations to ensure minimum levels of health and safety for consumers. Companies and teams whose work is in or connected to such industries are expected to comply with the laws and with any ethical guidelines that are promulgated by the competent regulatory authorities.

Therefore, when a team undertakes a project, one of the first things that they should do is to get to know what the legal boundaries are so that they avoid getting involved in anything that goes against the law. Beyond this, they should apply ethics in those aspects of their work in which there are no specific guidelines because laws have not been made yet. For example, a team from a country where harmful chemical emissions are regulated might go to work in a country where there is as yet no regulation. Ethical behavior in this case would mean that they should try their best to regulate themselves in order to avoid causing harm to the environment. Again, a team may be engaged developing an online application that has the potential to harm people in a way that is not yet captured in criminal law. Since they understand the general reasons behind legal systems, ethical behavior would then mean that they find ways to avoid the possible harm to others even if laws have not yet been crafted for the specific activity that they engage in and even if this means that the project costs them more time, effort, or money.

### Personal Values and Sense of Responsibility

When values that are positive for human flourishing are practiced and become habitual, they are called virtues. Even when these are shared by team members, they are often practiced individually and derive from the person's upbringing, religion, family, school, life experience, etc. Virtues that make teaming easier include honesty, prudence, temperance, fortitude, justice, charity, generosity, patience, loyalty, constancy, humility, sincerity, diligence, courage, meekness, and solidarity. A team member who is impatient, arrogant, quarrelsome, dishonest, or disloyal needs to improve his or her character in order to be an asset to the team. Without such change, the person can make it difficult for the team to achieve its goal, or even destroy the team. A sense of responsibility is of particular importance, because it moves the person who has it to accept and display responsibility for the tasks entrusted to him or her as a member of the team and for the achievement of the team's goals.

### Dangers of Unethical Behavior: Team Pitfalls

Within a team, there are several dangers. One type of danger is group polarization, when strong voices within the team treat differences of opinion as disagreements in order to make their opinion appear as better than other opinions (Frey 2007). Another danger is lack of respect for cultural differences, which may cause unnecessary conflicts (Blanton 2013). Team members should study each other's differences in culture and background so as to understand them better. This would also help the team to be sensitive to one another so that teams, and their leaders, do not inadvertently or deliberately isolate or victimize more vulnerable members. In general, members need to learn to prioritize the team's goals above personal interests when needed, as individualistic mindsets will tend to hinder the team's progress (Blanton 2013).

A team could also behave unethically as a whole (Wechsler 2010) by jointly doing something that is unethical. Should this happen, members can help to restore the affected ethical

standards in different ways. For example, a member can speak up and challenge the team to change its ways or, if this fails, the member can report the ethical misconduct. This means that individual members of a team should be bold enough to hold each other accountable and check the behaviors of others in the team. For example, members should be ready to report corruption (Wechsler 2010), calling out the whole team or the leader (s), on this issue, if needed. They should also be able to notice when a team is holding the bigger organization to ransom and obstructing its progress, for example, a team of salespeople could deliberately slow down their response to sales leads and hence lose revenue for their employer company in order to make the point that their team is essential to the company's continued profitability. In such cases, this team may become a problem for the organization rather than a support. Team members should also watch out for groupthink, which is a tendency for a strong group to be defensive when faced with ideas or data that contradict its collective position or plans and to disregard these (Frey 2007). If individual team members are not aware and on guard against groupthink, it could cause them to not examine the ethics of a decision or action closely when the team is strongly tempted to do something wrong.

### Conclusion

Teams are made up of members each of whom has a responsibility to work well with the other team members in order to achieve the team's goal. For this purpose, the team could agree to some internal rules which would guide ethical behavior in the team. Besides internal rules, a team is subject to external rules that are derived from their status as citizens of a country or state employees in a company or members of a professional body.

Ethical teamwork requires virtues in communication, joint decision-making, collaboration, self-management, and accountability. To help everyone to practice virtues and work well internally, teams need codes of ethics and codes of conduct. Teaming works better when members have shared values and a similar work ethic. Setting internal team rules helps to establish and homogenize these

to a large extent, wherever there are differences. Setting them early helps the team to work optimally (e.g., to hold effective meetings).

Although there are dangers that teams in particular need to watch out for, personal values and ethical codes will help individuals, and through that, the whole team, to consistently act consistently in an ethical and responsible manner.

## Technology Ethics: Origins, Paradigms and Implications for Business and Society

Peter Seele  
Corporate Social Responsibility and Business Ethics, Faculty of Communication Sciences, Università della Svizzera italiana (USI), Lugano, Switzerland

## Synonyms

Digital ethics; Digital transformation; Solutionism; *Techné*

## Introduction

Technology ethics is both a rather old and young field: *Old* in the sense, as *technê* (τέχνη in ancient Greek) means *doing* and *practice*, including the specific methods and contexts. The term has been subject of philosophical reflection since philosophy's beginning with Socrates and Plato, where it was used to describe human knowledge in general, before Aristotle began to differentiate between *technê* and *epistêmê*. The ethical relevance of *technê* is therefore inseparable from what humans do and what implications their doing has on other humans and third parties including society at large. Technology ethics, however, is a *young* and contemporary field, as with new technologies such as computing, digitalization, algorithms and big data the impact of technology to the *condition humana*, society, politics, business, the economy at large, and the environment has reached heights unprecedented and levels of autonomy also novel and unparalleled. Technology ethics has become a key domain in applied ethics and as digital technology is said to have a disruptive effect and leads to a digital transformation or even a new “digital age” (Schmidt and Cohen 2013). If reality catches up with rhetoric and promises remains to be seen, particularly if put forward by corporate players like former Google CEO Eric Schmidt having a different agenda than, for example, a historiographer. It can be said, however, that the relaunch of Technology Ethics has inspired a new and vibrant field of debate and research, which is particularly of interest for other discourses of applied ethics like political philosophy, professional ethics, bioethics, and most of all business ethics, as the impact on business and society is created particularly by the new generation of large digital platform companies like Google, Facebook, Weibo, Amazon, Tencent, Apple, or Microsoft along with more specialized companies like Uber, Alibaba, Airbnb, or less public and intel-driven digital companies like Palantir or NSO Group.

In the following the article presents a short historical overview, present day key topics and debates with a particular focus on the business and society nexus plus finally an outlook for

emerging and yet dormant themes of technology ethics.

## Historical Overview

The term technology and its etymological root *technê* have been contextualized differently at different times. This created and still creates terminological confusion. In the following, different historical stages are presented, explaining where the term was relevant and shaped (for a more in-depth overview see Richard Parry's article on "Episteme and Techne" (2020)).

- Antiquity: with the birth of philosophy, the term entered the scene and comprised systematic human activity of creating something. This involves both the skills and the method and processes.
- Modernity: With overcoming the medieval times, progress became a goal in itself. Rationality and technology were the means to achieve this progress to start modernity, enlightenment, and industrialization (Blumenberg 1985).
- Nineteenth to twentieth century: A more engineering-driven notion of technology was developed in Germany ("Technik") linking the concept closer to social life and societal change. With World War II and the nuclear bombs at Hiroshima and Nagasaki the annihilating power of technology was widely discussed and led to concepts like technology assessment (or the German "Technikfolgenabschätzung", where also ethical considerations were discussed and linked to policy research. But other technologies like genetically modified creatures and crops, dual use cases and advanced weapon technologies gave rise to critical assessments of technology and its ethical implications
- Today: With digital technology, also technology ethics was given a new boost. The implications of increased computing power, big data and intelligent algorithms, and machines led to a relaunch of Technology Ethics, as technology more and more shifts from passive execution to

automated decision making. This criterion marks crucial differences in the evolution of technology and technology ethics, as it impacts normative and moral questions in a way where agency and responsibility of (new) actors and blurred lines between natural and legal persons occur. As more and more virtual agents take decisions, the question of responsibility has to be asked anew – up to the question if machines should also have legal rights (Gunkel 2018). On the contrary the role of humans is changing, now becoming "dataviduals" understood as "aggregate of data" (van der Meulen and Bruinsma 2018: 3).

As for the different stages or paradigms mentioned here, the paradoxical ascription, that technology ethics is both ancient and novel becomes clearer. As contemporary and novel technology ethics addresses challenges unprecedented, the remainder of the article addresses solely contemporary questions:

## Contemporary Key Topics and Debates

### Automation, Replacement, and Dehumanization

One of the major topics regarding technology ethics and business and society is automation due to big data and AI-algorithms. Several studies, among them the alarmist Oxford study, state that millions of jobs will be lost to machines. This fuels fears and anger in the light of the digital disruption. At the same time algorithms take over management of operations and human resources. One case documented is the taxi-app Uber. A study revealed, that drivers exposed to evaluations by the algorithm, which takes decisions on intransparent criteria feel "dehumanized". More and more algorithmic decision-making and surveillance capitalism therefore lead to negative perceptions although digital technology also allows for pro-social innovations, for example in the health sector. Nevertheless due to the increasing perceptions of dehumanization (a discourse well established in other ethical fields such as colonialism or

alienation of work) digital technology may also have an effect on the *conditio humana*, which has been described as “machinization” of humans due to AI (Seele 2020). In sum the implications of technology not only have impact on business efficiency and society at large, but also on a micro level on the anthropology in a digital age.

### Surveillance and Surveillance Capitalism

Digital technology allows surveillance of persons, processes and transactions in a way unprecedented so far in history. The degree of intelligence-involvement of mirroring, shadowing or surveillance as reached a new high with sensors and cameras all over recording and computing large amounts of data. This new level of surveillance has been theorized combining technology with business ethics as “surveillance capitalism” (Zuboff 2018) going back to previous work, when the “age of the smart machine” started in 1984 (Zuboff 1984). Historically surveillance theories with regard to technology may also be traced back to Jeremy Bentham and his concept of the panopticon.

### Artificial Intelligence, The Example of Personalized Pricing

Powerful algorithms and tools (called “artificial intelligence,” which is an exaggeration or marketing trick, not a description of what is) increasingly also organize processes in the business world in an automated way. From a business ethics perspective algorithmic pricing is one of the applications fields, that early on build on digital technology to get closer to the maximum price equilibrium. Two subcategories of algorithmic pricing emerged, that also pose ethical questions: dynamic pricing and personalizes pricing (Seele et al. 2021). Whereas dynamic pricing takes into account general parameters such as season, weekends of supply and demand (like the gas price at gas stations), personalized pricing is much more controversial in ethical terms: Platform companies collect personal data of users, which in return are used to estimate a consumption profile to calculate a probable willingness-to-pay. Unlike dynamic pricing this technique belongs to micro-targeting on the level of individuals. Depending on where users

live, what jobs they have, or what previous purchases they have made, prices are personalized to make the maximums for the company. This may include also age, sexual orientation, or other highly private parameters. This is why personalized pricing ethically is seen as discrimination, particularly when the algorithms are not made transparent.

### Bias

As the previous example of algorithmic pricing shows, digital technology is used to assess business-relevant information. The general assumption however is, that an algorithm is more neutral than humans, as humans often display discriminatory behavior. Where technology was assumed to be objective and neutral and thus also allows for less unethical decision-making, it turned out that this cannot be confirmed. Algorithms are also subject to bias and distortions, challenging the ethicality of technology and its objectivity. Two main sources for bias in digital decision-making have been identified: (1) Biased data: following the old statistics rule of thumb: garbage in: garbage out, algorithms being fed and trained with biased data sets, produce biases results. (2) Programmers as human beings also have biases. Therefore the biases of programmers also are replicated in the algorithm products they create. The neutrality of technology here turns also in being neutral to replicating bias, that already existed in the data and processes, though which technology is created.

### Cyberattacks on Corporations

Technology can also be used for illegitimate and illegal activities. Among the greatest threats is currently cybercrime and ransomware. Companies, public organizations and also individual users are being attacked by criminal entities taking digital infrastructure hostage and asking for a ransom, preferably to be paid through digital cryptocurrencies such as Bitcoin, Monero, Ether, or Dogecoin, just to name a few. Such cyberattacks may be described as “state of exception” (Knebel et al. 2021) asking for new measures of organizational learning how to deal with the blockage of entire organizations. The ethical challenges of cybercrimes, however, not

only touch upon upfront unethical and illegal behavior but also take advantage of secret-based technologies like blockchain and cryptocurrencies (→Blockchain and Cryptocurrencies, The Relevance for Business Ethics) and the fundamental value of privacy.

### Technology and Sustainability

Next to the ethical challenges and controversies of adverse activities, digital technology may also be seen as booster to pro-social change. One of the most crucial application contexts is sustainable development. With the collection of large amounts of data and automated data processing through algorithms, the harmful impacts of humans and their inventions like externalities of corporations, may be monitored and governed with much greater detail and complexity. Computational modeling allows for assessments and predictions informing stakeholders of all kind what measures to take. This leads to the implication that in the digital age also our notion of stakeholders as such changes from data producers, consumers, and analysts (Lock and Seele 2017). Digital technology with regard may also act as positive driver, as data sets across country boundaries allow for a more rigorous and detailed approach in fighting, for example, environmental system risks. This approach to share data for pro-social reasons has been labeled as “data-deliberation” (Schultz and Seele 2020) building on the Habermasian idea of deliberative democracy and discourse ethics for addressing governance vacuums or challenges that cannot be addressed adequately by individual actors. Taking the pro-social use of digital technology one step further corporate digital data as produced already for non-financial corporate reports (sustainability reports or corporate social responsibility reports), may be combined to build a digital copy mirroring the state of the world in a decentralized manner. This “corporate nervous net” (Knebel and Seele 2019) in return may be seen as an instrument for addressing grand challenges with joined forces, where the instrumental rationale of corporations may prevent for strategic purposes collaboration together with competitors and other stakeholders such as nongovernmental organizations or governments.

### Greenwashing and Machinewashing

The various hopes and expectations towards new technologies also led to a perception that more innovation will help coping with challenges unsolved so far. This not only positive but even euphoric perspective also led to a phenomenon called solutionism, applied to attract funding for start-ups, to play down concerns or to jump on the bandwagon of technological progress. In the business ethics domain we know this kind of instrumental behavior quite well with regard to misleading messages regarding environmental issues: it is called greenwashing. In analogy various authors expanded this concept also to technology to arrive at similar concepts best subsumed as machinewashing (→Greenwashing and Machinewashing: An Ethical Account and Criteria for Identification). Misleading communication strategies of corporations however have evolved in recent years and reached out to various contexts also touching upon technology. Among the various concepts of – washing the following can be enumerated as current state of affairs of concepts with published definitions: Bluewashing, Pinkwashing, Brownwashing/Whitewashing/Colorwashing, Fempowerwashing, Wokewashing, Poorwashing, Veganwashing, Machinewashing, Humanwashing, Cloudwashing/-AI-Washing/Blockchainwashing, or Ethicswashing. As the listed concepts cover various aspects of ethical concern, it is obvious, that quite a number of those concepts relate to the realm of technology. This is also noteworthy as the fashion of new technology-terminology evolves with high speed to boost new concepts associated with new hopes, expectation and sales stories.

### Outlook on Privacy and Secrecy

As the term Digital Transformation already indicates, the change is ongoing and topics, questions and challenges are in the making. The topics mentioned in the previous chapter may provide some spotlights on areas of concern also with regard to business and professional ethics. However, some topics and questions just begin to emerge and deserve special attention, as their impact is expected to be huge. One of these emerging topics

is the nexus between privacy and secrecy. Privacy in open societies is a fundamental right, the “right to be left alone”. The same holds for secrecy, particularly as for example secretive voting is a key pillar of open democratic societies. Nevertheless, as described above with the example of cybercrimes, the protection of privacy and secrecy may also be used to camouflage illegal and ethical illegitimate behavior. At the same time, overshooting surveillance of private users creates the notion that privacy does not exist anymore, and a new theory of privacy without secrecy is in need (Seele and Zapf 2020). Ethically pro-privacy can also be seen in the historical fact, that in times of non-democratic or even totalitarian or fascist regimes, privacy and secrecy are important to rebuild democratic institutions or to take measures such as civil disobedience against oppressive regimes. This is, for example, one of the reasons why the Tor-internet browser allowing anonymous surfing in the internet and dark-net is justified from the point of view of democracy. Nevertheless, together with cryptocurrencies, the Tor-internet browser also facilitates easy transactions of highly unethical and illegal nature. Therefore and in closing, the role of technology from an ethical perspective remains a key field of applied ethics to address questions mentioned in the context of the business and society nexus.

## Textile Industry in the United States

April E. Sellers  
Kelley School of Business, Department of  
Business Law & Ethics, Indiana University,  
Bloomington, IN, USA

## Synonyms

Apparel and fabric regulations

## Introduction

Those who produce or sell textile products should be aware of laws relating to (a) the importation of those products; (b) labeling, advertising, and safety of textiles; and (c) intellectual property (trademark, copyright, etc.) issues. Moreover, ethical issues have bogged the textile industry for more than a century.

## Legal Issues

### Importation of Fabrics

In the past, there were limits on textile imports. For example, an agreement between the United States and China limited the import of thirty-four (34) categories of textiles into the United States until the end of 2008 (O'Neal 2006). A little-known federal agency called CITA (Committee for the Implementation of Textile Agreements) oversees the import of fabrics. The US Department of Commerce oversees the issuance of licenses to importers.

Today, the US Customs and Border Protection imposes tariffs on certain imported goods, including textiles. Tariff schedules are available at [www.cpb.gov](http://www.cpb.gov). Moreover, imported textiles must be labeled to show the country of origin (see Informed Compliance Publications, accessible at [www.cbp.gov/trade/rulings/informed-compliance-publications](http://www.cbp.gov/trade/rulings/informed-compliance-publications)). Country of origin is "the country, territory or insular possession in which a good originates or of which a good is the growth, product or manufacture." 19 CFR §102.21-25. As described in further detail below, it is unlawful under the Federal Textile Fiber Products Identification Act to import a textile that is misbranded or deceptively advertised.

Readers should be aware that regulations in this area change frequently. See, for example, the "Presidential Proclamation To Implement the Nepal Preference Program and for Other Purposes," granting duty-free status to goods imported from Nepal (see <https://www.gpo.gov/fdsys/pkg/FR-2016-12-20/pdf/2016-30738.pdf>).

### Labeling, Advertising, and Safety

The Federal Trade Commission (FTC) is charged with enforcing most advertising laws, including

those related to textiles. Those laws include the Textile & Wool Act (15 USC §70), which requires that advertisements and catalogs disclose whether the fabric was made in the United States, was imported, or both. For a fabric to be labeled "Made in USA," it must entirely or virtually entirely be made in the United States. The law allows for a fine of \$16,000 per violation, and customers can bring a civil lawsuit.

A federal statute, the Flammable Fabrics Act (16 CFR §1609.1), requires that fabrics be tested for flammability and prohibits the manufacture or importation of fabrics that do not meet its standards for flammability. Importantly, consumers who are injured from flammable clothing or furnishings may bring a civil suit against the manufacturers even if the manufacturer complied with the Act (Smith 2017).

Similarly, another federal law, the Textile Fiber Products Identification Act of 1960 (15 U.S.C. §70b(B)(4)), requires that textile products be labeled to show the fiber content and prohibits the misbranding or false or misleading advertising of textiles. The FTC enforces the law. Under the Act, a textile product is misbranded if it does not show the country of origin where the product was processed or manufactured.

Finally, commercial parties can claim that textile advertisements (including labels or package inserts) are false or misleading under a federal law known as the Lanham Act, 15 U.S.C. §1125(a). Those claims can include allegations that an advertisement misleads customers into believing that a product is made in the United States. See *Toddy Gear, Inc. v. Navarre Corp.*, 2014 WL 4271631 (N.D. Ill. August 26, 2014). The law allows competitors to seek damages, arguing that the seller is luring away customers through deceptive advertising. State laws also allow for suits based on false advertising of goods, for example, the Illinois Uniform Deceptive Trade Practices Act, 815 Ill. Comp. Stat. 51 § 2.

### Intellectual Property

"Intellectual property" refers to the areas of trademark, copyright, and patents. Copyright law protects the design of many products but does not protect "useful articles," which generally includes

clothing. Therefore, the design of a fabric can be copyrightable, but the design of a piece of clothing that uses that fabric often is not. The design is copyrightable only if it can be analyzed separately from the utilitarian features of the item – for example, the arrangement of blocks of color in a particular way on a dress that can be recreated on various other items (shirts, handbags, etc.). Therefore, the design of many “useful” items such as shirts, dresses, and furniture – without some separable design elements – is not protected by copyright laws. See *Varsity Brands, Inc. v. Star Athletica, LLC*, 137 S.Ct. 1002 (2017), upholding the ability to copyright the design of a cheerleading uniform.

Trademark law is relevant to textile manufacturers because it protects logos and other distinct marks against copying. This is of limited use if the overall style of an item is copied but not the mark itself (Raustiala and Sprigman 2006).

Finally, patent law gives the patent holder essentially a monopoly on a product or design for a certain number of years (often 20). Design patents are available for original textiles and the products into which they are incorporated. See *Times Three Clothier, LLC v. Spanx, Inc.*, 2014 WL 1795210 (S.D.N.Y. May 6, 2014). Among other requirements, the design – in order to be patented – must not be “obvious” in light of the products in existence at the time (this concept is known as the “prior art”). See, for example, *PBI Performance Products, Inc. v. NorFab Corp.*, 514 F.Supp.2d 732 (E.D. Penn. 2007)

### Ethical Issues

Many high-profile cases of dangerous working conditions have happened in the garment industry. In the United States, the most famous is The Triangle Shirtwaist Factory in New York, where nearly 150 employees died in a fire in 1911. Those killed were mostly girls and young women, many of them immigrants. They were trapped inside and, in many cases, jumped to their deaths. The tragedy factory sparked worker protection reforms.

More recently, more than 111 workers died in a fire in Bangladesh at the Tazreen Fashions factory. Workers at the factory stitched clothes for sale in

Europe and the United States, whose buyers denied knowing about the source. The International Labor Rights Forum says more than 600 garment workers in Bangladesh have died in fires since 2005 (Yardley 2012).

## Theoretical Grounding of Democratic Accountability

Steven G. Koven

Department of Urban and Public Affairs,  
University of Louisville, Louisville, KY, USA

### Synonyms

Business ethics; Public consent; Responsiveness;  
Social responsibility

### Introduction

Democratic theory has ancient precedence, dating back at least to the year 507 B.C., when the leader of the Athenian city state introduced a system of political reforms that allowed power (kratos) to be given to the people (demos). The concept of rule by the people henceforth became embedded as a feasible means of governance. This concept was widely embraced by British philosopher John Locke as well as US Founding Fathers. In the *Declaration of Independence*, Thomas Jefferson wrote that “governments are instituted among men, deriving their just powers from the consent of the governed.” Abraham Lincoln in his Gettysburg Address stated that “the government of the people by the people and for the people shall not perish from the earth.” These statements reflect the essence of the idea of democratic accountability that is grounded in the ancient Greek principle that the people should rule. In theory, the people are the best judge of their conditions, leaders are not masters but temporary servants of the people, and in words that are attributed to Abraham Lincoln, some the people may be fooled all of the time, all of the people may be fooled some of the time, but in the long run all the people will not be fooled all the time—will recognize and vote their interests.

It is evident that democracies thrive when the people actively participate in the process, have real choices made available to them, and are able to make independent judgments. In regard to

commerce, business owners must recognize that they do not operate in a vacuum with unlimited power. As John D. Rockefeller’s Standard Oil Company learned at the turn of the twentieth century, business prerogatives are not unlimited; democratically elected representatives can push back on what constituents perceive to be rapacious monopolies. Democracies can and have held powerful interest to account. Democratic theorists, however, do not universally agree regarding the role average citizens actually play in governing. Various models of democratic accountability are presented below.

### Models of Democratic Accountability

#### Trustee and Delegate Models

Unanimous consent does not exist in regard to how representative democracies such as the United States should operate. Debate about representation often surrounds two conflicting perspective regarding how elected representative should cast their votes: (1) a delegate model and (2) a trustee model. The delegate model views elected officials as representatives of their constituents and therefore elected representatives should be responsive to the sentiments of voters. The model does not provide for autonomous decision-making; it does not believe representatives should do anything more than reflect the views of constituents. In contrast, the trustee model proposes that elected officials should be able to exercise independent judgment and should be able to vote in accord with their idea of the general good rather than simply mimic the views of constituents. Trustees can act on their conscience on the basis of some conception of civic virtue. In contrast, under the delegate model, representatives reflect the interests of constituents.

The Anglo-Irish statesman, Edmund Burke (1729–1797) represents an exemplar of the trustee model. The model specifies that (1) national legislation ought to aim at the national good; (2) the representative, in deliberation with other legislators, should be the ultimate judge of what constitutes that national good; (3) the representative should be less responsive to electoral sanctions;

and (4) representatives should be motivated by civic virtue. Burke defending the national good as the proper aim of legislation. He promoted the view that representatives rather than constituents or a third party should be the source of proper judgment. Burke did not follow the wishes of his constituents when he was in Parliament and failed to be returned at the next election. In contrast, the delegate model was supported by the opponents of the American Constitution in the 1780s who contended that: (1) legislation should be in the interest of electoral constituency, (2) citizens are the source of judgment about what constitutes that interest, and (3) representatives are responsive to the threat of sanction by voters (Rehfeld 2009). At various times, elected leaders defied the wishes of constituents and were voted out of office. In addition to the trustee and delegate models, democratic theorists differ on the extent to which they believe average citizens have input into the system. These differences are found in the citizenship and elite theories of democracy.

### Citizenship and Elitist Theories of Democracy

Citizenship theory rests on two essential assumptions: (1) citizens are autonomous agents, and (2) citizens can improve their decision-making over time. The assumption of autonomy is based on the view that citizens are the best judge of their own interests while the construct of improvability rests on the belief that citizens should be treated as capable of showing over time better judgment. Citizenship calls for the active political involvement of ordinary citizens (Thompson 1970, 10). This ideal was pithily summarized by the aphorism attributed to Abraham Lincoln, “You can fool some of the people all of the time, and all of the people some of the time, but you cannot fool all of the people all of the time.” Citizenship theorists assume that people will not be fooled all the time and that leaders will adhere to the wishes of the people. Citizenship theorists posit that the average citizen is most aware of “where the shoe pinches” or where problems exist in society. This knowledge is essential for legislation and to inform representatives about the experiences of ordinary citizens. The free expression of people who know their own best interests serves

as a check on arbitrary power and a constraint on leaders whose policies are antagonistic to the interests of the people (Koven 2008, 19). The view that the wishes of the people should be respected and that leaders should serve the public interest is consistent with the principles of the Geneva based philosopher, Jean-Jacques Rousseau as well as the author of the Declaration of Independence, Thomas Jefferson. Jeffersonian democracy is associated with respecting the will of ordinary citizens such as yeoman farmers. Jefferson was antagonistic to elites represented in the merchant, banker, and manufacturer classes of the late eighteenth century. He was devoted to the principles of representative government and civic duty.

In contrast to Jefferson and citizenship theories, Alexander Hamilton and his supporters cautioned against following the views of the masses. He feared mob rule and strove to limit access to the levers of power. Hamilton characterized direct democracy as a both a disease and a poison. At the 1787 Constitutional Convention, Hamilton sought to install systems to check the unsteadiness of the masses. He argued that the rich and well born should be given a distinct, permanent share in government because the people seldom judge or determine what is right. More contemporary advocates of what has come to be known as the elitist perspective of democracy include writer and political commentator Walter Lippmann (1889–1974) and Harvard Professor Joseph Schumpeter (1883–1950).

Lippmann’s writings fall clearly within the camp of democratic elitism. In his widely read book *Public Opinion*, Lippmann (1922) argued that the masses were spectators rather than participants in the democratic process. He contended that the sole responsibility of the masses was that of choosing between one of two parties that maintained few general differences. The masses only needed to support the “ins” when things are going well and to support the “outs” when things seemed to be going badly. Lippmann contended that the average citizen is not able distinguish between truth and the fictions they embraced as the truth. This is attributed to two main causes. First, the news media prevented citizens from

gaining access to the real truth. Media constraints included censorship, distortions arising from the need for short messages, and the difficulty of explaining a complicated world. Second, Lippmann argued that even if these problems ceased to exist, the limiting nature of the human mind would prevent a realistic representation of the truth. He termed the simplified version of reality on which citizens base their actions the “pseudo-environment.” Lippmann’s proposed solution for the problem of citizen misperceptions was to redirect political decision-making away from the masses and toward a centralized body of intelligent elites (Whipple 2005, 160). He is considered an elite theorist of democracy not only because of his advocacy for rule by experts but also because of his belief that average citizens were manipulated by others. He believed that citizen sovereignty was a fiction; the people might reign in theory but not in fact.

The Austrian émigré to the United States, Joseph Schumpeter rejected the concept of a common good. He contended that the meaning of the common good was unobtainable since different people and different groups will not agree on its meaning. In contrast to citizenship theorist, Schumpeter (1943/1981, 269) adopted the more limited view of democracy as simply a competitive struggle for people’s votes. Under this version of democracy, people have an opportunity to accept or refuse their rulers, but once leaders are elected, the people should not exert pressures until the next election. Elite democratic theorist such as Schumpeter were more concerned with the quality of leadership than the ability of citizens to govern wisely. He concluded that modern industrial capitalist societies engender too much social conflict to provide the conditions necessary for classical democracy. According to Schumpeter, individual wills are divided in modern capitalist societies; the political environment of capitalism engenders increased hostility. This environment is bound to produce movements for public policies and social reform that diverges from traditional pro-business perspectives. Schumpeter argued that capitalism also creates a new middle class who express attitudes and interests that differ from both those of the working class and big business. The tensions

between the views of business and advocates of social responsibility is evident in the evolution of models that diverge away from the classical economic model of business toward that of alternative perspectives such as the stakeholder model of corporate social responsibility and the strategic model of corporate social responsibility.

## Views of Business Accountability

Business ethics literature has evolved to include not only the classical economic view but also more modern models that suggest business must be held accountable for their actions. These variants of business ethics are consonant with Schumpeter’s belief that in capitalist societies tensions will develop between the varying interests in society. These tensions are witnessed in three variants of corporate social responsibility: (1) the economic model, (2) the stakeholder model, and (3) the strategic/sustainability model (DesJardins 2011, 54–74).

### Economic Model of Corporate Social Responsibility

The economic model of corporate social responsibility proposes that the role of business is to maximize profits within the law. Nobel laureate, Milton Friedman is perhaps the best known defender of the economic model. Friedman (1962, 133) maintained that corporate officials do not have a social responsibility that extends beyond serving the interests of their stockholders. He concluded that in a free market economy, there is one and only one social responsibility of business, that responsibility is to use its resources and engage in activities designed to increase profits so long as the business stays within the rules of the game. They should engage in open and free competition without deception or fraud. Under this model, managers are to be accountable to stockholder rather than the general public and have no social responsibility other than to make as much money as possible for their stockholders. Friedman contended that if executive spent company money on social causes, he or she was spending somebody else’s money for their own purposes.

Spending money on social causes is rejected on principle in that it can reduce returns to stockholders, raise the price of goods to customers, and lower the wages of some employees. Friedman argued that the appropriate agents of social causes are individuals, and that when companies concern themselves with the community rather than profit, it leads to a loss individual freedom and undermines the basis of free societies.

The contention that the only ethical responsibility for business is to maximize profit has been equated with moral minimalism. A growing chorus of critics, however, attack this perspective as too limited because of its disregard for the concern of anyone but stockholders. It is evident that others including customers, workers, and communities also have a stake in business decisions. This perspective is delineated in the stakeholder model of corporate social responsibility.

### **Stakeholder Model of Corporate Social Responsibility**

The stakeholder model of corporate social responsibility recognizes that every business decision affects a wide variety of people, imposing costs and generating benefits to select groups. The model notes that ethical claims of stockholders must be balanced against comparable claims of others affected by management decisions. Freeman (1984) developed this perspective, suggesting that multiple stakeholders need to be involved and play a vital role in the success of businesses. Stakeholders include governmental bodies, political groups, communities, trade associations, unions, financiers, suppliers, employees, and customers. The task of the manager is to keep the support of groups and balance their interests over time. Stakeholders have been interpreted from both a narrow (any group or individual who are vital to the survival of a company) and broadly (any group or individual who can be affected by a company). From the perspective of democratic accountability, both the narrow and broad conceptions of stakeholders must be taken into consideration.

The stakeholder model is supported by established law that recognizes business responsibilities to others such as workers, environmentalist, and the disabled. DesJardins (2011, 70)

argued that business must be responsive to the interest of the broader society, stating that “legal precedent did not simply fall from the sky. It is the considered judgment of the most fundamental institutions of a democratic society, the courts and the legislatures that corporate management must limit their fiduciary duty to stockholders in the name of the rights and interests of various constituencies affected by corporate decisions.” The stakeholder model therefore is more aligned with the democratic interests of society and more accountable in that it rejects that narrowest conceptualization of corporate responsibility that was advanced by Milton Friedman and free market libertarians. The third model of corporate social responsibility pictures social responsibility as part of the very mission, or strategic vision of companies.

### **Strategic Model of Corporate Social Responsibility: Sustainability**

Similar to the stakeholder model, the sustainability model considers the interests of multiple stakeholders but further stresses the importance of protecting the rights of future generations. The sustainability model provides a vision for creating a world in which people can meet the needs of the present generation without jeopardizing the ability of future generations to meet their own needs. The model responds to the need to create a more just and environmentally sound economic system. It aspires to foster a business community that addresses human needs without diminishing earth’s capacity to support life. It also hopes to create a business environment that is ethically sensitive enough to protect human dignity (DesJardins 2005, 35).

A fundamental assumption of the sustainability model is that a firm’s financial goals must be balanced against other goals, especially the goal of ensuring a sustainable environment. In addition, various organizations such as hospitals, non-government organizations, foundations, schools, colleges, and government agencies have adopted social goals as fundamental to their missions. These organizations do not view social responsibility as external to their goals, nor do they view responsibility as a zero-sum game that will negatively affecting bottom line performance. The

sustainability model argues that businesses can be both profitable and exhibit concern for future generations. Furthermore, the model contends that regard for the future is in the best interests of business.

## Discussion and Conclusions

Democracies survive through the consent of the governed. Governments are constructed in order to protect rights and freedoms of citizens. Freedom for individuals, however, is not unlimited. Businesses, for example, may wish to maximize profit regardless of the consequences of their action. Individuals may wish to pursue their selfish desires regardless of the costs they inflict on others. Democratic accountability rests on the idea that organizations and individuals must not only pursue their own aims but must also be cognizant of their responsibilities to the broader public. Democracies should reflect the wishes and aspirations of majorities while at the same time protecting minority rights.

As John D. Rockefeller, Sr. learned private businesses in democracies do not exert unlimited power. In 1906, the US government brought suit against Standard Oil Company (New Jersey) under the Sherman Antitrust Act of 1890. In 1911, Standard Oil was ordered to divest itself of its major holdings. In 1974, the United States Department of Justice filed an antitrust lawsuit against the telephone company, AT&T. At the time, AT&T was the sole provider of telephone service throughout most of the United States. In 1982, AT&T agreed to relinquish control of the Bell Operating Companies that had provided local telephone service in the United States and Canada up until that point. This took away the monopoly of the Bell System and split it into separate companies that would continue to provide telephone service. Today, legislators have become interested in the activities of the massive Facebook, Inc./Meta Company. The company's founder Mark Zuckerberg has come under pressure for Facebook's pursuit of profit and disregard for the impact the company's platform may have on users.

Authors disagree on their conceptions of democracy, some place their faith in the ability of citizens to make wise decisions, and others are skeptical about the role that the masses should play in governing. Sensitivity to the desires of the populace is a foundational principle of democratic accountability. In the past, democratically elected legislators have successfully reigned in the powerful through legal action and legislation. Whether this pattern will be able to continue remains to be seen.

## Theoretical Perspective on the Relationship Between Management Accounting Control and Trust

Michelle C. Lau

Goodman School of Business, Brock University,

### Synonyms

Accounting control; Control systems; Management accounting control systems; Management control; Planning and monitoring control

### Introduction

The following article is intended as an introduction to management accounting controls and trust, and the relationship between one another. Management accounting controls refer to the informal or formal policies, procedures, and tools used to influence other members of the organization and to maintain or alter patterns in organizational activities (Simons 1995). Examples of management accounting controls include setting accounting standards, performance measurement, balanced scorecard, costing techniques, designing and implementing incentive schemes, variance analysis, performance evaluation, and budgetary control. Trust can be defined as a willingness to be vulnerable to the actions of another party based on the positive expectations that the other party will perform an action important to the vulnerable party despite uncertainty regarding their motives and/or prospective actions, irrespective of the ability to control or monitor the other party (Mayer et al. 1995). Trust and management accounting controls are often cited both simultaneously and independently as crucial elements of any organizational relationship whenever risk, uncertainty, and/or interdependence exists. Trust and management accounting controls are both found to reduce inter and intra organizational complexities, transaction costs, and conflicts.

They can also yield positive effects such as promote co-operation, satisfaction, and improve performance among other measures of economic and social benefits to an organization.

Management accounting controls and trust facilitate and manage relationships both within and across the organization via their influence upon the ethical climate of an organization (see also ► [“Ethical Climate and Ethical Culture”](#)). Ethical climate refers to the behaviors that are perceived to be ethically correct, and the way in which ethical situations are handled in the organization (Victor and Cullen 1988). A strong ethical climate implies an organization’s ethical values are embedded in the management accounting controls, and in turn the actions of the employees. A strong ethical climate may yield high levels of trust among organizational stakeholders. For example, an ethical climate can permeate throughout an organization from the top down via its management accounting controls; in turn, positive expectations (i.e., trust) may build among stakeholders regarding the ethical intentions and actions of the organization and its leaders. Likewise, a weak ethical climate may result in low levels of stakeholder trust as the importance of ethical values is given low priority within management accounting controls. Alternatively, the presence of management accounting controls may signal distrust as trust is built on a positive expectation that is irrespective of the ability to control or monitor the other party. Thus, management accounting controls not only promote trust but can also degrade trust in certain contexts. In this way, the relationship between trust and management accounting controls remains not fully elucidated as the conditions under which management accounting controls promote or degrade trust are empirically unknown.

The study of trust and management accounting controls from a multitude of theoretical perspectives, levels of analysis, and methodologies has given rise to numerous definitions, complexities, and conceptual confusion. Trust by itself has been described as a personality trait, behavioral intention, social structure, psychological state, an expectation, a behavior, emotional state, and as both a noun and a verb (McKnight and Chervany 2001). Moreover,

numerous related but distinct constructs such as integrity, honesty, co-operation, benevolence, competence, reliability, predictability, trustworthiness, and distrust have added to its conceptual confusion. In general, a key question remains – is trust a separate and distinct concept from management accounting control; or does trust represent a construct that is one and the same?

Although any social science can provide a theoretical basis for the study of management accounting controls and trust, the vast majority of accounting research on trust and management accounting controls is informed by economics, psychology, and sociology (Covaleski et al. 2003). Within each theoretical perspective, there exist various methods and approaches to collect and analyze data including archival research, field interviews, survey, case research, and laboratory experiments. In addition, they have been studied in various causal model forms as dependent variables, independent variables, and mediating moderating variables in a variety of scenarios. Trust and management accounting controls span different levels of analysis as they can be studied at the individual level, between individuals and organizations, at the level of intra-organizations and beyond. Trust and management accounting controls can also be studied from various points of time. Seeking a better understanding of the relationship between trust and management accounting, along with conceptual clarity, presents a common goal across multiple theoretical perspectives, units of analyses, and methodologies. In this article, the relationship between trust and management accounting controls are further considered from the theoretical perspectives of economics, psychology, and sociology.

### **An Economic Perspective on Trust and Control**

From an economic perspective, trust can be construed as a rational, unbiased, calculated decision based on the impact of cost/benefit tradeoffs on future wealth. Agency theory plays a central role in accounting research. In general, agency theory describes the relationship between one or more persons (the principal) that engages another

person (the agent) to perform some service on their behalf (Jensen and Meckling 1976). Two basic assumptions are central to this theory. First, each party operates according to his or her self-interest. Second, the principal and agent are rational and capable of forming unbiased expectations of prospective decisions. Agency theory can be used to study trust and management accounting control as it gives rise to scenarios in which a strong lack of trust exists. The cause and effects of incentives and monitoring (e.g., agency costs) dominate the literature on trust and management accounting control. A game theoretic methodology is often applied to examine trust from this rationalist perspective.

From an economic perspective, trust and management accounting controls can be framed as a substitute versus complement relationship. At times, trust is operationalized as a substitute for management accounting controls. The greater the level of trust between principal and agent for example, the fewer the required safeguards required to manage the relationship. On the other hand, trust can be viewed as a complement to management accounting controls. That is, trust and control are considered separate but parallel concepts. Both constructs can exist simultaneously. Implementing management accounting controls does not necessarily imply a lack of trust; however, given a specific level of trust, the implantation of a particular management accounting control may be required to reach a desired level of confidence.

### **A Psychological Perspective on Trust and Control**

Trust and management accounting controls can also be examined from a psychological perspective. In general, psychology is concerned with understanding the thoughts, emotions, and behaviors of the individual rather than those at the organization or societal level. Importantly, human thought, emotion, and behavior are assumed to depend upon the mental representations of the environment. These mental representations can differ in important ways from the

underlying objective reality, giving rise to deviations from rational or unbiased judgment and decision making (Birnberg et al. 2006). Psychological theories can be used to understand the relationship between trust and management accounting control from a subjective standpoint. Whether trust can be construed as an informal, social control or separate and distinct from management accounting control depends on various psychological variables.

The possibility of psychological variables that affect and are affected by trust and management accounting controls can be derived from the theoretical subfields of psychology that include social, cognitive, and industrial/organizational psychology. These subfields give rise to cognitive and contextual cues such as the social context in which the trusting relationship arises (e.g., social history), attitudes of the trustee and trustor (e.g., judgments of trustworthiness), and individual differences such as the willingness to take risk and to rely on others that can affect the mental representation of the trust/control relationship.

Recently, a neuroscientific approach has attempted to understand how the human brains along with neuropeptides (e.g., oxytocin) influence decisions involving trust (Sanfey et al. 2006). The aim of such research is to provide a better explanation of the underlying biophysical factors that drive human decision-making and social behaviors. Examining the neuroscientific implications on trust and management accounting controls may help to clarify whether these constructs are unique or synonymous with one another. In particular, this approach may be used to reveal the ways in which management accounting controls and trust respond similarly (or not) with the underlying human condition and pathologies such as phobias, personality disorders, and individual abilities.

## **A Sociological Perspective of Trust and Control**

A sociological perspective offers insights into organizations, the social world in which they

operate and how individuals react in these scenarios. Sociology examines trust and management accounting controls in terms of their function within society and are studied at the level of the organization and beyond. From a sociological perspective, trust is considered as an integral aspect of the social context in which economic and social transactions are embedded. In turn, it is the social context that influences the design of management accounting controls.

To illustrate, contingency theory is premised on the assumption that a singular optimal equilibrium of an organization fails to exist. Rather the choices of an organization depend upon the organization's unique circumstances such as the nature of the organization, its environment, technology, size, structure, strategy, and national culture. In this way, the choice or form of management accounting controls is understood by the various internal and external environmental factors that may or may not also be affected by trust. Thus, varying levels of stakeholder trust may call for different levels of management accounting control. From a sociological perspective, the question remains as to whether trust and management accounting control are unique or identical constructs.

## **Conclusion**

To date, researchers from a variety of theoretical perspectives appear no closer in their quest towards finding conceptual clarity on the relationship between trust and management accounting controls. Yet recognizing trust and management accounting controls as fundamental blocks in developing and facilitating social relationships remain common across economics, psychology, and sociology. While each perspective offers unique assumptions, theories, and variables, a holistic approach may prove fruitful in developing a more complete framework of trust and management accounting controls. Moreover, a holistic approach may help to reduce conceptual confusion as researchers from one perspective begin to recognize key similarities and differences across

other perspectives. Lastly, taking a combined theoretical approach reinforces the importance of trust and management accounting controls in every aspect of the social functioning of organizations.

## Toxic Leadership

Clive R. Boddy  
Tasmanian School of Business and Economics,  
University of Tasmania, Hobart, TAS, Australia

## Synonyms

Machiavellian management; Narcissistic leadership; Psychopathic leadership; Toxic management

## Definition

Toxic leadership involves abusive, destructive control of people and resources whereby an organization and its members become seriously harmed and weakened. Toxic leaders, according to Jean Lipman-Blumen (2004), are leaders who are destructive to their organizations, their employees, their nations, and their constituents. Further, she argues that toxic leaders first charm but then manipulate, mistreat, weaken, and ultimately devastate their followers. Toxic leadership poisons rather than nourishes those who are led and leads to organizational decay and ultimately destruction. Lipman-Blumen writes that toxic leaders – such as Ken Lay at Enron or Al Dunlap (“Chainsaw Al”) at Sunbeam – have always been among us and that these leaders appeal to followers’ innermost needs, playing on their worries, fears, and need for security, high self-esteem, and a feeling of significance.

## Description

Following the views of Hogan and Kaiser (2005) and their colleagues, leadership is arguably the foremost subject of investigation in the human sciences, because it is very influential on organizational outcomes and on other people’s lives (Hogan and Kaiser 2005). Toxic leaders are undoubtedly the most influential type of leader and therefore the most important to study so that lessons can be learned from the past to inform and guide decisions made in the future. Nevertheless, toxic leaders have been described as a painful but common fact of life in many organizations. Indeed, to many observers, there is a continuing crisis of unethical leadership across the globe.

Commentators on leadership have explicitly conjectured as to what enables ruthless and toxic leaders to emerge in corporations and to ascend the corporate and political pecking order to reach senior positions. It appears that this is possible because toxic leaders can, through careful manipulation of their image and self-presentation, appear to be glittering examples of wonderful, strong leaders who pledge a renaissance, a return

to greatness, and a golden future for the organizations or societies they purport to serve.

Lipman-Blumen describes how toxic leaders emerge because they look like attractive candidates and useful employees. They are unafraid of self-promotion, and they understand how to appeal to the psychological needs and desires of others for strong leadership, authority, safekeeping, inclusion, and recognition. In doing so, these toxic leaders appear to be strong, talented, and steadfast, which sways other people to follow and support them (Lipman-Blumen 2004).

Furthermore, toxic leaders, even when their true characteristics become apparent, ascend comparatively unobstructed because their colleagues and reports are at a loss as to how to deal with them. For example, Delbecq (2001) in the paper called “‘Evil’ Manifested in Destructive Individual Behaviour” reported that employees are poorly prepared to deal with disordered leadership personalities because employees have no reference point or experience of dealing with someone who acts so outstandingly outside the standards of customary behavior. These toxic leaders are willing to be ruthless, demeaning of others, vigorous, disingenuous, predatory, dissembling, and manipulative and so become a powerful disruptive force within organizations, demoralizing others and creating fear and paralysis.

Goldman (2006) discusses how aberrant personalities can be a source of a highly toxic and dysfunctional organizational behavior, for example, in his 2006 paper called “High toxicity leadership: Borderline personality disorder and the dysfunctional organization.” Thus one toxic leader, identified by Lipman-Blumen (2004), Adolf Hitler, despite being diagnosed as a psychopath in 1933, was able to rise to power in twentieth-century Germany. He was closely aided by (at least) two other psychopaths who were his deputy leaders. Goering was diagnosed as a psychopath and described as a narcissist during the Nuremberg war trials in 1946, while Hess, Hitler’s deputy, was diagnosed as a psychopath in a British prison in 1941.

As discussed, these types of ineffective and toxic leaders have been identified as having personality traits such as narcissism, Machiavellianism, and

psychopathy that mark them as dissimilar to other people. Such toxic leaders are arguably more likely to rise to leadership positions and more liable to fail in their leadership from the point of view of the organization as a whole. In managerial and leadership positions, toxic managers can make the workplace seem like a war zone to those involved with the toxic manager (Lubit 2004). Lubit writes that such toxic managers are a fact of life within organizations and that while some managers are toxic most of the time, others are toxic some of the time.

The extent of the effect of the toxic leader depends on the magnitude of the influence they hold. Thus, at the departmental level, for example, everyone in the department is directly affected by the toxic leader, while the whole organization also suffers from the inefficiencies caused (Boddy and Croft 2016).

Consequences of toxic leadership include reduced employee job satisfaction, lowered employee commitment to (Mehta and Maheshwari 2013) and engagement with the organization, absenteeism, high employee turnover, and organizational decline and destruction.

## Traditional Chinese Culture and Its Impact on Modern Business Ethics

Robert Shanklin<sup>1</sup> and Michael A. Santoro<sup>2</sup>

<sup>1</sup>Philosophy Department, Santa Clara University, Santa Clara, CA, USA

<sup>2</sup>Department of Management and Entrepreneurship, Santa Clara University, Santa Clara, CA, USA

### Introduction

Despite immense political and economic changes in the twentieth century, certain aspects of traditional Chinese culture continue to be influential in contemporary business and society. Very many day-to-day social interactions, including those that comprise business, continue to be guided by elements of traditional Chinese culture. This is especially so regarding Chinese perspectives on ethics and business. Contrary to many first- and second-hand reports that doing business in and with China involves no ethics at all, China is not a place without ethics. To resolve this apparent contradiction, one must understand the foundations of traditional Chinese ethics and culture, so as to grasp the fundamentally different starting points of Chinese and Western approaches to ethics and business.

### Differing Ethical Foundations: East and West

Many of the categories, concepts, and distinctions that organize Western cultures do not translate

into Chinese culture contexts. For example, the common Western saying “it’s not personal, it’s business” makes no sense in Chinese culture contexts. In China, and much of East Asia, you avoid doing business with people you do not know personally. This is for a variety of reasons: there is no Western-style rule of law in China to resolve business disputes; typically one wants to avoid being involved with the government and legal system rather than rely on them for help; and historically, interpersonal relationships starting with families and clans were the organizing units of Chinese society. Instead of depending on rule-of-law, the legal system, or the government to regulate business, one builds and maintains close personal relationships which are the foundations for trust in day-to-day interactions, including business. One depends upon such relationships to reduce risk of ethical failures and to problem-solve when crises occur.

Another distinction that does not apply in Chinese culture contexts is that of ethics versus etiquette. In the West, one typically distinguishes between matters of etiquette (which are generally less weighty) and matters of ethics (which are weightier). Generally speaking, an etiquette-gaffe does not have ethical consequences. In Chinese contexts however, the divide is much less sharp – behaving correctly means getting both ethics and etiquette right. This is one reason why business deals in China sometimes fall apart suddenly because of apparently “little” things like an unintentional misunderstanding or social gaffe that implies disrespect. To Chinese mindsets, many of these are not little, but instead failures with potentially significant ethical implications. This is not to say that Westerners doing business in Chinese cultural contexts must have perfect Chinese manners – Chinese counterparts are generally aware of the difficulties of perfectly learning other cultures – rather, given a certain amount of leeway, Westerners should still expect what seem like “little” mistakes to be taken more seriously in Chinese culture contexts.

A second starting point of Chinese approaches to ethics, which distinguishes them from Western ones, is the relative importance of context. Western approaches start from the assumption that

ethics involves disinterested codes of behavior that apply to everyone. These codes comprise impartial universal rules such as “treat everyone equitably,” “be honest,” “don’t treat others as mere means to your own ends,” “promote happiness,” and so on. Such are not starting points for Chinese approaches, which are highly skeptical of universal rules of behavior, often view such rules as harmful and even naïve. A passage from the Confucian *Analects* – one of the most influential texts in Chinese culture – illustrates this point:

13.18 The Duke of She said to Kongzi (Confucius), “Among my people there is one we call ‘Upright Gong.’ When his father stole a sheep, he reported him to the authorities.”

Kongzi replied, “Among my people, those who we consider ‘upright’ are different from this: fathers cover up for their sons, and sons cover up for their fathers. ‘Uprightness’ is found in this.” (Ivanhoe and Van Norden 2005, p. 39)

Confucius is critical of the rigid rule-following behavior of “Upright Gong,” and moreover what was true of Confucius’ “people” became generally true for Chinese people. This passage also illustrates the point from the preceding paragraph – interpersonal relationships, in this case family relationships, rather than some universal duty to law or authority, underpin Chinese perspectives on what constitutes ethical behavior. On these perspectives, the starting point for ethics is to understand context – to understand the specifics of the situations one encounters, which include the particular relationships in play – that in turn determines correct behavior. This is not to say that Western ethics is all-rules while Chinese ethics is all-context, but rather to say that Chinese approaches emphasize context as the starting-point of ethical reasoning, whereas Western ones emphasize disinterested universal rules.

Perhaps as a consequence of Chinese approaches to ethics being organized around context, including relationships, as their starting point, Chinese ethics requires a refined ethical sense, or insight. One must be able to perceive the relevant aspects of the situations one faces so as to discern proper versus improper behavior. This involves being “tuned in” to things that Western ethics would not typically consider of

ethical importance, such as certain matters of culture and etiquette, including returning favors to those with whom one has close personal-business relationships. Another example is that public conflicts – including disputes as well as accusing people and organizations of wrongdoing – which appear fairly common in many Western culture contexts, are considered horribly rude in Chinese contexts. In general, there is an ingrained cultural preference to avoid overt conflict assiduously, including in business meetings and negotiations. This is one reason why so many Chinese businesspeople go to great lengths to avoid saying “no” to someone’s face. Instead of getting frustrated with Chinese counterparts who nod in understanding but do what they were going to do anyway, Westerners can cultivate their ethical insight, allowing them to “tune in” to these background, and sometimes subtle, Chinese cultural realities. When both parties share the same insight, it is perfectly clear that “it would be difficult” means “no,” while “maybe” means “probably not.”

Despite important differences in communication styles and attitudes towards open conflict, there is a point of comparison here with Western ethics. Western virtue theories, for example Aristotelianism, can agree with Chinese approaches that ethically cultivated people have a kind of insight or “ethical sixth sense” that allows them to perceive when a particular situation has ethical implications, and to discern how best to act. This insight takes a long time to cultivate – for Confucians and Aristotelians alike, this is generally achieved by a combination of education and real-world experience. Daoists (also spelled “Taoists”) can also agree that ethically cultivated people have such ethical insight but would disagree on how it is acquired. Daoist perspectives are skeptical that external educational and social norms always lead towards living our best lives, instead holding that we will achieve greater harmony with each other, and with the natural world, by resisting the desires, ambitions, and sense of urgency that society so often imposes on us. Differing individuals and organizations may adopt or emphasize these related but distinct ideals in various ways – the Confucian emphasis

on learning can be seen in Chinese perspectives on the importance of education, while the Daoist resistance to urgency and ambition can be seen in Chinese tendencies towards patience in negotiations as well as avoidance of overt conflict.

## Face and *Guānxi*

In business in China, getting things done, reducing the chance of mishaps and fixing things when problems boil over, requires understanding two interrelated aspects of what determines correct versus incorrect behavior within one's relationships and relationship networks. The first is called "face" which is the English translation of two different words in Chinese *miànzi* (面子) and *liǎn* (臉). The second is *guānxi* (關係), which may be loosely translated as influence through reciprocal social connections. It is safe to say that Westerners who have done business in China have heard of face and *guānxi* and understand them to be crucial ideas in Chinese business environments. However, the cultural depths behind these terms are very rarely understood in adequate detail or precision. As a result, face is commonly and over-simplistically thought to involve simple flattery and sensitivity to public image, while *guānxi* is often interpreted as cronyism, or in the worst case, as an opportunity to curry favor through bribery (Santoro and Shanklin 2021, Ch4). Superficial versions of face and *guānxi* are misrepresentative of the authentic ethical values and principles behind these familiar terms.

As a first approximation, we can think of one form of face, *liǎn* (臉), as being more inward-focused, while the other *miànzi* (面子) is more outward-focused (Hu 1944). For one to have face in terms of *miànzi* means that other people outwardly treat one as having prestige, social status through influence and connections, as well as personal, professional, and financial success. There is a kind of symbiosis here; the more of those things one actually has, the more face one expects to be shown, and at the same time, the more that other people tend to render outward shows of respect the more face (*miànzi*) one has.

*Liǎn* is more inward-directed in the sense that it is less about how much respect other people show, but is instead about whether a person is perceived as having an upstanding moral character and is thought to exhibit decent behavior under all circumstances. If one has significant *liǎn*, it is believed that they should be conferred significant *miànzi* as well, insofar as to typical Chinese mindsets one deserves or warrants success and prestige (*miànzi*) if one is perceived as having good character (*liǎn*).

Both forms of face are important for doing business in Chinese cultural contexts. However, *miànzi*, the outward directed form, is more important for Westerners because they can take actions to increase *miànzi* for their Chinese counterparts, and thereby gain greater opportunities, cooperation, and compliance. Though there is less that Western executives can do to promote *liǎn* for their Chinese counterparts, they should know that *liǎn* is operating just below the surface. In typical business interactions, the types of behaviors that Westerners can use to increase face (*miànzi*) for Chinese counterparts include: using proper Chinese etiquette including knowing how to act as a guest to one's Chinese hosts; expressing knowledge and interest in mainstays of Chinese culture including art, calligraphy, music, theater, history, food, and tea; reciprocal gift-giving; giving Chinese counterparts ample opportunities to demonstrate their knowledge and skill, as concerns both culture and business; and understating one's own accomplishments, skill, and knowledge as they can promote the interests of one's Chinese counterparts. Giving face is central to building and maintaining relationships with them, which in turn allows one to develop *guānxi*.

Properly understanding *guānxi* requires understanding not only the importance of cultivating and maintaining personal-business relationships but also the networks they form, as well as being able to act according to Chinese ideals of reciprocity. Understanding relationship networks, and being able to act properly within those networks, is how one becomes able to exert power and influence through one's relationships. Understanding relationship networks means understanding that each Chinese counterpart has their own

networks, which will not necessarily overlap, and as a result there are almost always more relationships in the room than meets the Western eye. Being able to act properly according to Chinese ideals of reciprocity within relationships means not only being able to crucially give face (*miànzǐ*) to Chinese counterparts but understanding that *guānxi* takes time to develop and best develops organically, ideally over the course of months to years. Exercising *guānxi* well comes with several requirements, including maintaining an attitude of collaboration and cooperation even when you perceive conflicts with Chinese counterparts; avoiding asking for direct favors and instead indicating indirectly that there is some concern or problem to be addressed; avoiding any kind of blame or finger-pointing, especially as regards anything to do with China and its culture; and, giving clear priority to longer-standing and closer relationships over new acquaintances, strangers, and random authorities.

## Conclusion

The preceding discussion describes key basics for understanding Chinese approaches to ethics in business as they contrast, and to some extent compare, with Western ones. However, these basics rest on a complex conceptual landscape of Chinese history, religion, philosophy, and hence, culture. To more fully understand the enduring influence of traditional Chinese culture on contemporary Chinese society and business, one must not only understand but also become fluent in applying several principles that organize this cultural landscape and guide the ecosystem of relationships. The first has already been mentioned: harmony. Whereas Western approaches to ethics often aim at maximizing good, or achieving excellence, Chinese approaches to ethics generally aim at promoting harmony (*héxiè*, 和谐), in the sense of harmony within families and social groups, work units, society generally, and even with the environment (Ivanhoe and Van Norden 2005, 207–309). This is another reason why competition, for instance, over resources – which is unavoidable in business and in life – should not be overt, and moreover is to be strategic about

minimizing damage to social relations and expending resources (Santoro and Shanklin *forthcoming*, 2021, Ch5).

A second guiding principle is hierarchy, sometimes more narrowly translated as “filial conduct” or “filial piety,” in relationships (*xiào*, 孝). In Chinese culture contexts, nearly all personal-business relationships have some hierarchy: a more established or senior co-worker outranks more junior co-workers even if they have the same job title, a more established or accomplished friend can outrank a less-established one, older brothers outrank younger, and despite laws to the contrary, men, generally speaking, outrank women. A third guiding principle is *rén* (仁), often translated as “benevolence” or “humaneness.” In different ways, both are apt. On the one hand, humaneness can be understood as all-encompassing, in the sense that the more ethically cultivated a person is, the more fully they treat themselves and others humanely. A narrower, but equally accurate, notion of *rén* consists in behaving benevolently towards those within one’s network of relationships, especially towards those who are your near-equals, juniors, and subordinates. Both *rén* and *xiào* were originally associated specifically with Confucianism, but over time became integral to Chinese culture generally, as well as to many East Asian cultures influenced by Confucianism, including Japan, South Korea, and Vietnam. There are other values and principles that undergird Chinese approaches to ethics, including as they relate to business, but these are ones that one sees most often day-to-day, and that one most needs to understand Chinese versus Western approaches to business ethics.

## Tragedy of the Commons and the Lifeboat Metaphor

Deborah C. Poff  
Brandon University, Ottawa, ON, Canada

## Synonyms

Population pressure; Rationale for anti-immigration policies

## Introduction

In his famous 1968 article, Garrett Hardin introduces his version of the “tragedy of the commons.”

Picture a pasture open to all. It is to be expected that each herdsman will try to keep as many cattle as possible on the commons. . .

As a rational being, each herdsman seeks to maximize his gain. Explicitly or implicitly, more or less consciously, he asks, “What is the utility to *me* of adding one more animal to my herd?” This utility has one negative and one positive component.

1. The positive component is a function of the increment of one animal. Since the herdsman receives all the proceeds from the sale of the additional animal, the positive utility is nearly +1.

2. The negative component is a function of the additional overgrazing created by one more animal. Since, however, the effects of overgrazing are shared by all the herdsman, the negative utility for any particular decision-making herdsman is only a fraction of –1.

Adding together the component partial utilities, the rational herdsman concludes that the only sensible course for him to pursue is to add another animal to his herd. And another; and another. . . But this is the conclusion reached by each and every rational herdsman sharing a commons. Therein is the tragedy. Each man is locked into his own best interest in a society that believes in the freedom of the commons. Freedom in a commons brings ruin to all.

To this little story, in two other, almost identical, articles, Hardin (1974, p. 561) complements his view of the tragedy of the commons with a metaphorical story about global populations where rich nations represent lifeboats and poorer nations are in other life boats that can’t sustain them, so the populations end up swimming desperately and wanting to be saved through a place in a rich nation’s lifeboat. The ethics of the lifeboat is as follows:

Metaphorically, each rich nation amounts to a lifeboat full of comparatively rich people. The poor of the world are in other, much more crowded lifeboats. Continuously, so to speak, the poor fall out of their lifeboats and swim for a while in the water outside, hoping to be admitted to a rich lifeboat, or in some other way to benefit from the “goodies” on board.

In both articles, it does not take a great leap of logic to understand his political arguments. And, political is what they actually amount to rather than the dubious scientific assumptions underlying his points.

First, with respect to the tragedy of the commons, Hardin wants to argue that commons cannot be jointly managed because every individual will pursue their own self-interest until the commons are extinct. With respect to the lifeboat, if rich nations let poor nations into their lifeboats, then all the rich nations would be overwhelmed and swamped, so the rich boats have to keep out the poor. Hardin does not leave these conclusions implicit, and he does explicitly talk about the need to control immigration into the United States and

the need for population control, which he argues is out of control in lesser developed countries.

Frischmann et al. (2019) note Hardin's tragedy of the commons "has been incredibly influential in biology, ecology, and various social sciences, including economics." Further, Hardin has been re-popularized more recently by political right-wing groups in the United States. Despite this, economists in particular have noted the confused assumptions underlying Hardin's "stories." For example, as Ostrom (1998) and Frischmann et al. (2019) point out, Hardin is confused in his discussion of an exhaustible, natural resource as "commons." Ostrom, in particular, spent her career studying successfully managed commons where she argues that "reciprocity, reputation, and trust are at the core of an empirically tested, behavioral theory of collective action" with respect to the commons. Hardin describes his "commons" where rationally self-interested persons will individually continue to follow their own self-interest without any rational justification for why individuals would participate knowingly in such self-defeating and resource-exhausting manners. Much work has been accomplished since Hardin initially wrote his theory on the recognition of business and communities in needing to account for exhaustible resources, such as air and water, in determining courses of business practice. The laws and business ethics of economic development have changed significantly to recognize the need to manage resources as part of stakeholder theories of corporate ethics and social responsibility.

Frischmann, Mariano, and Ramello summarize the problem with Hardin's commons example:

The allegory, however, is reductionist and distorting. It includes a series of assumptions with respect to both resources and resource management that severely limits its generalizability. Simply put, Hardin's description of the tragedy of the commons ruled out – by assumption – the possibility that people might communicate and find ways to cooperate.

Similarly, Hardin's lifeboat articles articulate prejudices as facts where he assumes that the poor will continue to grow their population uncontrollably if not stopped and that developed nation states

such as the United States will require constraints against reproductivity and borders to keep out the poor from "swamping" the lifestyles of the wealthy.

Hardin's ultimate goal is control of population size. As he states quite baldly, "freedom to breed is intolerable," and he further states that the UN Declaration of Human Rights is invalid in its claim of the right of families to determine their size. He further notes that "the social arrangements that produce responsibility are arrangements that create coercion, of some sort." His conclusion is a call for coercive control of breeding, particularly with respect to populations in lesser developed countries.

## Transaction Costs and Business Ethics

Alejandro Agafonow

## Definition/Introduction

Deal-making comes at a cost. Unless the parties trying to reach a deal – any deal – are thought of as having perfect knowledge (Jevons 1888), or taking part in free communication as if gathered in a single place (Edgeworth 1881), or informed about the terms of exchange in a public and centralized way, as on a stock market trading floor (Walras 2010), in real-world conditions a deal has to go through a process of information gathering about its potential benefits, which adds costs to the act of transacting. This kind of additional cost is known as a transaction cost, which according to Coase (1960) is borne of the act of finding the partner we want to deal with, informing her about the terms we require to make a deal, the negotiation of these terms, and framing guarantees for the deal to be observed.

Insofar as business ethics is defined as a “branch of applied ethics that studies the moral dimensions of commercial activity, frequently but not exclusively with respect to corporations” (Encyclopædia Britannica 2016), the role of transaction costs in business ethics becomes evident: The methods and strategies to carry out commercial activities bear certain transaction costs but not all methods and strategies, however efficient in economizing on transaction costs, are ethically permissible. Put differently, it can be said that the interface of transaction costs and business ethics branches out to the study of deontic constraints, i.e., obligations and permissibility, on profit-making strategies (Heath 2006).

## Description

Unlike other streams of business ethics following a *voluntaristic approach* concerned with the rightness of the behavior of executives and business people (Freeman and Reed 1983; Friedman and Miles 2006) – such as stakeholder theory – the combination of transaction cost economics (TCE) and business ethics aims to shed light on *issues of structure*, that is, to show how the constraints of law, organizational form, and culture condition the behavior of firms when implementing a set of methods and strategies to economize on the

cost of transacting. Thus, it is accepted from the outset that the contractual and quasi-contractual relations between a firm and its constituencies are normatively infused (Norman 2010).

Defining deontic constraints on profit-making strategies may open, however, a can of worms: From a purely normative point of view, it is difficult to determine the feasible limits to the ethical behavior expected from a firm – insufficiently qualified calls for firms to take stakeholders into consideration being all too familiar. Thus, TCE brings to business ethics a much-needed realism that can potentially temper ethical prescriptions.

It is not possible to identify, in the abstract, which specific methods and strategies to economize transaction costs are ethically permissible. TCE calls for a discriminating understanding of governance mechanisms that account for the organizational variety observed in market economies (Williamson 1984a), including markets, hierarchies, hybrids (i.e., combinations of market and hierarchical mechanisms, not to be confused with the “hybrid organizations” researched in management scholarship), and public bureaucracies (Williamson and Ouchi 1981; Williamson 1999).

## Example: The Corporation as Hierarchy

By way of illustration, a hierarchy that has attracted the most attention and controversy is the corporation. The corporation’s limited liability over owners’ private assets and the separation of ownership and control, that is, the executive managing the corporation is in principle separate from those who hold a share of the firm’s ownership, is not a spontaneous outcome of the evolution of capitalism. The modern corporation has been effectuated by legislators with an aim that over time has become apparent, namely to increase the sources of finance for firms whose assets are highly specific and therefore less likely to receive financing from banks. Since to get a loan one needs to have assets that can easily be transformed into cash, banks are less likely to consider highly specific assets as collateral (Williamson 1981, 1984a, b, 1985, 1988, 2002, 2008, 2011).

Ethical calls to regulate corporations often see corporate law – part of the structure that constrains

corporations' behavior – as the appropriate place to look for remedies to corporate misconduct. A TCE approach to the corporation would normally consider very seriously certain red lines, namely whether a reform of corporate law is a more efficient means to consider the interests of the worst off than, for instance, investing in social policy (Norman 2010), or whether the regulation of corporations can be better achieved by either tinkering with the prices they confront or revamping their structure (Easterbrook and Fischel 1996).

Thus, demanding a change in a corporation's structure to make it more accountable to non-equity stakeholders, without appropriate qualification, no matter how compatible with our moral convictions, is likely to reverse legislators' aim to unleash equity capital as a powerful source of economic progress. This would be the case if power in the boardroom is either lawfully or de facto shared with stakeholders whose interests would be better served by a management that does not meet shareholders' expectations of profitability. "As put by Marcoux (2000): Who would provide equity capital to such a firm, knowing that the very fact that they have equity capital to provide means that the firm, in most cases most of the time, will be distributing the benefits of the firm to others, rather than to oneself? (95)".

An ethical perspective on changes in the corporation's structure should keep this TCE insight in mind, and inquire further into the pros and cons of two basic normative approaches to thinking about the corporation: Will the corporation be thought of as containing the terms shareholders would have negotiated should the cost of arm's length negotiations be sufficiently low (Easterbrook and Fischel 1996)? and will the corporation be thought of as containing the terms society would have agreed upon should the cost of unanimity be sufficiently low (Michelman 1967)?

These two normative bases for conceiving the corporation, i.e., Easterbrook and Fischel's (1996) and Michelman's (1967) approaches, differ in the constituencies deemed entitled to have a say in shareholders' private matters (i.e., respectively shareholders alone versus stakeholders, more broadly), and can be the source of two equally

misleading conceptions of the corporation: libertarian and progressive, respectively.

On the one hand, conceiving the corporation in terms only shareholders would have negotiated assumes that the corporation has no significant impact on third parties. On the other hand, a corporation organized according to the terms society would have agreed upon assumes away the dis-incentives shareholders would face should the corporation be managed to the unqualified satisfaction of everyone. TCE can bring equanimity to our normative judgments.

Thus, the challenge the interface of transaction costs and business ethics is called to face is to provide a nuanced answer to the following question: Why would anybody accept less than an equal share of a corporation's output? The short answer is: Because investment in highly specific assets is likely to plummet if those most likely to finance them (shareholders) are forced to relinquish the benefits of presiding over managers in control of the very assets they finance (the corporation). Thus, anybody demanding an equal share of a corporation's output must ask herself whether she would be better off in a scenario which does not see highly specific assets being put to work. Or, to put it more concretely, can we reasonably expect Tesla and Panasonic to invest in the nascent industry of electric vehicles by agreeing to produce long-range battery packs specific to Tesla's vehicles if shareholders are not allowed to be the residual claimants of the uncertain benefits of this risky investment?

## Transformational Leadership

Deanne N. Den Hartog  
Faculty of Economics and Business,  
Section Leadership & Management, Amsterdam  
Business School, University of Amsterdam,  
Amsterdam, The Netherlands

### Definitions/Introduction

Transformational leaders articulate an attractive and challenging vision of the future. They infuse work with meaning, stimulate followers intellectually, stress the importance of the collective, and inspire followers to transcend self-interests. Followers become motivated and committed to contribute to the collective (Bass 1985). Transformational leadership is therefore a vision-centered and values-driven form of leadership.

### Transactional Versus Transformational Leadership

One of the most influential leadership style models of the past few decades, the Full Range of Leadership Model, contrasts transformational with transactional and laissez-faire leadership. Laissez-faire leaders are essentially passive, not taking their leadership responsibility. More active are transactional leaders. Transactional leadership approaches leader-follower interactions from an exchange perspective. An effective transactional leader recognizes what followers want to get from their work and tries to see that they get what they desire if their performance warrants it. Transactional leaders exchange both material and immaterial rewards or promises thereof for the agreed and appropriate levels of effort and respond to followers’

self-interests as long as they are getting the job done (e.g., Bass 1985; Bass and Riggio 2006).

Transformational leaders go beyond this cost-benefit exchange and motivate and inspire followers to perform beyond expectations. The dynamics of transformational leadership involve strong personal identification with the leader, joining in a shared vision of the future, and going beyond self-interested exchanges of rewards for compliance. Transformational leadership theories predict followers' emotional attachment to the organization as well as emotional and motivational arousal of followers as a consequence of the leader's behavior. Transformational leaders tend to be extroverted and proactive; they try to improve their work and organization and are future, change, and goal oriented. Transformational leaders define the need for change, create a new and attractive vision of a possible future, and mobilize commitment to their vision in followers who become motivated to attain the goals inherent in the vision and identify more with the leader and the unit. Through this vision and their behaviors, transformational leaders can ultimately transform individual followers as well as the collective (e.g., Bass 1985, 1997; Bass and Riggio 2006).

Although this type of leadership is mostly referred to as transformational, other terms, such as transforming, charismatic, inspirational, visionary, or value-based, are also used for strongly related styles of leadership. A core element of transformational leadership and these related styles is articulating an attractive vision of a possible future. The vision describes a better future in ideological terms and is congruent with the dearly held values of followers. Shamir et al. (1993) propose that leaders can instill pride, gain respect and trust, and increase a sense of optimism and hope in followers through articulating such a vision. By linking the work of followers to the mission, the work becomes more meaningful to them and can serve as a form of self-expression. The leader communicates the vision and acts as a role model of desired behavior. In other words, the leader's personal example serves as a model of the kind of behavior that is required to attain the vision. Role modeling is important because in doing so the leader provides an ideal, a point of

reference, and focus for followers' emulation and vicarious learning.

Besides articulating a vision and modeling desired behavior, transformational leadership also has several other components. Related to communicating their vision is using inspirational motivation and displaying charisma and self-confidence. Also, while a leader's charisma may attract subordinates to a vision or mission, Bass (1985) holds that the leader's individualized consideration and support of followers is also needed to gain desired results. Such behavior helps meet individual subordinate's needs and contributes to achieving their potential. Individually considerate leaders act as coach or mentor and aim to aid the personal development of followers. They provide feedback and link the individual follower's current needs to the organization's mission. Individualized consideration implies treating each individual as valuable and unique, not just as a member of the group.

In many models, intellectual stimulation is also seen as an important element of transformational leadership (e.g., Bass 1985, 1997). An intellectually stimulating leader provides subordinates with a flow of challenging new ideas to stimulate them to rethink the old ways of doing things and come up with new ones. Such a leader empowers employees to question the status quo, asks them to be creative in problem-solving and think out of the box, and allows them to break habits and routines.

## Outcomes of Transformational Leadership

The mechanisms through which transformational leadership is proposed to have positive effects on both individual followers and the collective include role modeling, enhancing identification, making work more meaningful for followers, stimulating change, enhancing follower efficacy, and raising positive affect. Indeed, both primary studies in the field and in the lab and several meta-analyses show that transformational leaders when compared to transactional leaders have subordinates who report greater trust, satisfaction, well-being, and commitment. Their followers are also

more motivated and more often exert extra effort. Research also shows that transformational leadership is also usually positively related to behavioral outcomes such as employees' organizational citizenship, creativity, and proactive work behaviors. Effects on performance have also been studied. Transformational leaders typically receive higher ratings of effectiveness and performance themselves and also tend to have higher performing followers, units, and businesses (see, e.g., DeRue et al. 2011; Judge and Piccolo 2004; Lowe et al. 1996).

### Transformational Leadership Across Cultures

Although different tools to measure transformational leadership exist, one of the most frequently used is the Multifactor Leadership Questionnaire (MLQ) developed by Bass and his colleagues. This questionnaire has been used in many countries around the world, and findings show that a preference for transformational leadership over transactional leadership exists in most cultures and that transformational leadership also generally correlates more positively with desired outcomes than transactional leadership (Bass 1997). Bass cautions that this does not mean that transformational leadership is expressed in exactly the same way in every country. For example, such leadership may take more or less participative forms, which likely relates to societal norms and values regarding the distribution of power.

Other empirical evidence also shows that both the positive endorsement and the positive effects of this type of leadership are found in a very wide range of countries. For example, the GLOBE project is a large-scale research project designed to assess both similarities and differences in the cultural semantic definition of leadership. Over 15000 middle managers from more than 60 countries around the world rated leader attributes and behavior that they perceived to enhance or impede outstanding leadership in their organizations. Leadership attributes that were universally endorsed as contributing to outstanding leadership included many that relate to

transformational leadership such as being encouraging, positive, motivational, a confidence builder, dynamic, and a good communicator and team builder and to have foresight (e.g., Den Hartog et al. 1999).

### Transformational Leadership and Morality

The earliest empirical work on transformational leadership usually portrayed this form of leadership as positive, moral, and value-based. Burns (1978, p. 20) even described "transforming" leadership as a process whereby "leaders and followers raise one another to higher levels of motivation and morality" and "transforming leadership ultimately becomes moral in that it raises the level of human conduct and ethical aspiration of both leader and led, and thus it has a transforming effect on both" (p. 20). Bass (1985), however, started to emphasize that transformational leaders could use their influence toward pursuing moral ends or immoral ones. To try to distinguish this, researchers tried to differentiate so-called authentic and pseudo-transformational leadership (e.g., Bass and Steidlmeier 1999).

Similarly, in the related field of charisma, personalized ("unethical") and socialized ("ethical") charismatic leadership were distinguished (e.g., Howell and Shamir 2005). These approaches often focus on the prosocial versus self-oriented use of power as well as the morality of both the means and ends the leader pursues to differentiate between "ethical" and "unethical" transformational leaders (Den Hartog 2015). For example, Bass and Steidlmeier (1999) hold that authentic transformational leadership has a moral foundation and is a positive and ethical form of leadership that emphasizes serving the collective rather than oneself. In contrast, pseudo-transformational leaders focus on self-serving rather than collective goals, and such leaders do not shy back from behaving immorally.

A complicating factor is that it is not always easy for those being led to distinguish the "good" from the "bad" as this requires knowledge of the leader's true intentions. Pseudo- and authentic

transformational leaders show many similar behaviors, and pseudo-transformational manipulative behaviors may not be obvious and may be hard to recognize or distinguish from authentic transformational behaviors. Dasborough and Ashkanasy (2002) propose that followers' attribution of leader intentionality plays a central role and argue that both leaders' ability to hide intentions and followers' ability to distinguish intentions and read the related cues will affect followers' ability to distinguish pseudo- from authentic transformational leadership.

Price (2003, p. 75) notes that "while transformational leaders can 'wear the black hats of villains or the white hats of heroes' (Bass and Steidlmeier 1999, p. 187), the problem is that leaders and followers sometimes fail to see all the colors of their own hats." He warns that in the leadership process, threats to morality cannot be reduced to egoism. Authentic transformational leadership assumes that people act on altruistic values for the good of their group, organization, or society, yet altruistic values and a concern for the group's collective outcomes can still compete with morality. Leaders could be pursuing goals that are in the genuine interest of their own group, yet that deny legitimate moral demands or rights of those outside the group. These rights of others beyond their own group are often not clearly considered or reflected in leaders' values or decisions, be these leaders transformational or not (Den Hartog 2015; Price 2003).

## Criticism

The conceptual and empirical work on transformational leadership is not without its share of criticism (see especially Van Knippenberg and Sitkin 2013). Their critiques include that a clear conceptual definition of transformational leadership is lacking and that the current multi-dimensional conceptualizations of this form of leadership do not sufficiently specify how these different dimensions combine or how and when they have their causal effects on mediators or outcomes. In addition, the conceptualization and measurement tend to confound transformational

leadership with some of its effects and measurement tools often fail to reproduce the dimensional structure specified by theory.

### Introduction

Transformational leaders are able to elevate their followers' motivation and to increase their performance beyond expectations (Bass 1985). Such leaders consider their followers individually, and are therefore aware of the needs, which drive their followers' behaviors, as well as of the values and aspirations they long for. Transformational leaders pick up these values in the vision they paint of the future of the workgroup or the entire organization. That way, they infuse work with purpose and intertwine work efforts with followers' self-views (Shamir et al. 1993). The higher meaning of work, which transformational leaders create through their inspiring vision, increases the intrinsic value of effort and thus followers' self-sacrificial behavior and performance beyond the call of duty (Shamir et al. 1993). Apart from communicating distal and vague visions, transformational leaders also set challenging goals and express confidence in their followers' abilities to fulfill the high-performance expectations they articulate (Yukl and Gardner

## Transformational Leadership, Visions, and Goals

The effectiveness of transformational leadership has commonly been attributed to the specific behaviors these leaders use in guiding and interacting with their followers (e.g., Shamir et al. 1993).

Transformational leaders show consideration for their followers and care about their personal needs and feelings (Podsakoff et al. 1990). Based on these close relationships, these leaders are not only aware of the values followers pursue, but also of the abilities, which set them apart, which is why they acknowledge their followers' contribution to the attainment of goals (Bass 1985). For that reason, transformational leaders delegate responsibility to their followers and stimulate them to re-examine their current way of working just as to develop new procedures and methods to conduct their work tasks (Bass 1985). In that, these leaders explicate the high expectations they have with regard to their followers' performance (Podsakoff et al. 1990). Transformational leaders develop and communicate an appealing vision tight to (ideological) values which followers aim to accomplish (Shamir et al. 1993). They, themselves, put more effort into work toward the achievement of the desirable future they communicate and align their words and actions. Therefore, transformational leaders become role models, which followers seek to emulate (Bass 1985).

Bass (1985) reasoned that the effectiveness of transformational leaders relies on their ability to increase followers' perception of the importance of organizational goals, to replace followers' self-interests by collective interests, and to implicate followers' higher-order needs. Likewise, Shamir et al. (1993) explained the effect of leaders'

charisma, a core component of transformational leadership, through their transforming impact on followers, which results from the leaders' ability to implicate followers' self-concepts by the vision they state. They reasoned that as transformational leaders align the vision they communicate with followers' values, working hard toward the attainment of the vision becomes a way of expressing oneself and one's belongingness to the social collective the higher-order vision serves. Effort becomes an important value itself as it contributes to the accomplishment of the compelling future end-state set out by the leader. If – in communicating their vision – transformational leaders manage to highlight effort as part of the collective identity of the workgroup, to which these leaders render their followers committed, effort becomes even more meaningful for each member. Accordingly, by emphasizing followers' collective identity and linking it with an attractive future state, transformational leaders are able to turn higher-order needs into followers' personal needs – self-interests and collective interests converge (cf. Shamir et al. 1993).

The articulation of an inspiring vision is hence one of the main motivational mechanisms of transformational leadership (cf. Shamir et al. 1993). Visions are commonly broad and general pictures of an abstract desirable end-state (Kirkpatrick and Locke 1996), although they may also pertain to the termination or prevention of an undesired state or to the provision of a more attractive alternative (Conger and Kanungo 1987). Visions concern an ideal, far-reaching, collective future, are commonly tight to shared ideological values or even moral aspects, are compelling, timeless and vague, they incorporate images in order to activate followers' emotions, and often highlight utopian outcomes (Berson et al. 2015; Kirkpatrick and Locke 1996). As such, visions are not necessarily meant to be attainable, but rather motivate followers' striving through their inspirational content (Kirkpatrick and Locke 1996). The desirable future end-state, the vision centers on, provides direction for followers' striving ("what?"), whereas its focus on the collective adds purpose to their efforts ("why?"; cf. Conger and Kanungo 1998).

Apart from their impact on followers' self-views and emotions, visions have also been described to stimulate exceptional performance through their impact on followers' cognitions (Ilies et al. 2006). According to Ilies et al. (2006), transformational leaders' visions may enhance the persistence, intensity and direction of followers' behavior, that is followers' motivation, through their translation into specific and concrete goals. The authors contend that specific goals arise from the overarching vision in terms of a cascading process: In this process, visions form the basis for the development of broader organizational strategies, which – in turn – are broken down into more proximal, concrete and finite, but also challenging goals (Ilies et al. 2006). This view is also shared by goal setting theory (Latham and Locke 1991). It suggests that effective leadership initially draws on an abstract vision for the team or organization to enrich work with meaning and to stir employees that way. Proximal goals are then used to implement the overarching vision, to transfer it into behavior, and to channel followers' actions during its pursuit.

## Transformational Leadership and Goal Setting

Setting followers goals is one of the primary tasks of leaders (Hogan and Kaiser 2005), and also transformational leaders complement their vision communication by the dissemination of challenging goals to their followers (Podsakoff et al. 1990). Just as visions, goals – defined as “the object or aim of an action” (Locke and Latham 2002, p. 705) – also refer to a desired end-state (Kirkpatrick and Locke 1996). Yet, they are tangible rather than abstract, have a limited and shorter temporal scope, relate to quantifiable performance, commonly concern a certain work unit and, most notably, should be attainable (Kirkpatrick and Locke 1996).

The crucial role that goals play for followers' work motivation and performance has widely been documented in laboratory and field settings (Locke and Latham 2002). Goal setting theory

(Latham and Locke 1991) or the high-performance work cycle (Locke and Latham 2002) are among the most studied theories in the field of organizational behavior. Among others, research aimed at identifying the core attributes of goals that are critical in eliciting followers' task performance. Findings show that goal setting is especially effective, if difficult and specific goals are set (Locke and Latham 2002).

Difficult goals evoke higher levels of performance as people are inclined to adjust their efforts to the requirements of a certain task, and simply strive harder if they work toward the attainment of more demanding goals (Latham and Locke 1991). Research confirms a linear relationship between goal difficulty and task performance (cf. Locke and Latham 2002). Specific goals, compared to vague or "do your best"-goals, on the other hand, lead to higher levels of performance as such goals provide a fixed external referent for adjusting one's efforts and evaluating one's goal pursuit. As the acceptable level of performance is clearly stated, individuals may not constantly redefine and adapt this level at their own discretion as would be possible if the goal was vague (Latham and Locke 1991). Specific goals provide clues on how to pursue them and thus help followers to focus on those behaviors, which contribute to accomplishing a particular goal (Berson et al. 2015). Evidence generally supports these assumptions if tasks are of low or moderate complexity. In case of complex tasks, though, specific goals turned out to be less important for an individual's performance (Locke and Latham 2002).

Leaders may thus directly affect followers' performance by the way they phrase and express the goals they set. Transformational leaders have a precise picture of the future end-state they want to achieve and are determined on their way toward its accomplishment. Therefore, they show personal sacrifice and exert themselves (Shamir et al. 1993), but also demand extraordinary performance on the part of their followers (Bass 1985). The goals transformational leaders set to supplement their vague vision, mirror their high demands and clear focus. They are high and specific.

Goal setting theory further states that the magnitude of the goal-performance relationship also depends on certain attitudes individuals may have with regard to the goals that have been set, most notably on their goal commitment: Only if people feel attached to them, high and specific goals may increase their task performance (Locke and Latham 2002). In order to develop commitment to a goal, followers, first, need to see its importance and, second, must perceive it as attainable. If people are convinced of the significance of a certain goal as well as of the consequences its attainment brings along, they likely adopt that goal as their own and try to accomplish it. As such, goal importance perceptions drive followers' determination in the goal pursuit (Maier and Brunstein 2001). High levels of goal importance perceptions, however, are not sufficient to increase a person's goal striving. People must equally feel able to attain the important goal. If they do not see any possibility for their efforts to pay off and their goal striving to be successful, they discard the goal rather than commit to it (Oettingen and Gollwitzer 2001). Perceiving a goal as attainable is thus necessary to first initiate one's goal pursuit (Heckhausen and Kuhl 1985). Accordingly, apart from boosting performance through the dissemination of high and specific goals, leaders may also stimulate followers' goal striving by getting them to perceive a goal as important and attainable (Locke and Latham 2002). Among others, leaders may emphasize the significance of a goal, describe it as an opportunity for self-improvement, provide reasonable rationales for its pursuit, spur followers' ambition, relate to the success of similar others, provide support in achieving it, or serve as role models of the behaviors necessary to progress toward its attainment (Latham and Locke 1991). Through the particular behaviors they use in guiding their followers, transformational leaders are even able to affect followers' goal importance and attainability perceptions in various ways and to induce higher levels of goal commitment.

**Transformational Leadership and Goal Importance** Transformational leaders are able to increase followers' perceptions of a specific

goal's importance (e.g., Steinmann et al. 2018). The concrete goals transformational leaders set are directly derived from the ideological vision they communicate to their followers (Ilies et al. 2006). As this vision is value-laden, appeals to followers' ideals, and implicates their self-concepts, goals cascaded from these visions are also congruent with followers' values and authentic interests (cf. Shamir et al. 1993). They are thus of high personal significance for them. By intertwining vision and goals with collective interests, transformational leaders further provide a rationale for the goals they set. If leaders explain the necessity of a goal, followers may comprehend its importance and commit to it (Locke and Latham 2002). Moreover, transformational leaders stimulate followers to reflect upon the meaningfulness of the goal that way as well as to consider the long-term consequences it might yield. Both lines of thought contribute to the adoption of a goal (Sheldon et al. 2002). In addition, these leaders illustrate the collective rewards associated with goal attainment, which directly fosters the importance followers attach to a goal.

Transformational leaders further involve followers in the decisions they take and delegate responsibility to them (Bass 1985). Followers may thus play an active part in the derivation and setting of goals. They develop a form of ownership if goals are jointly agreed upon, which results in higher levels of goal importance (Latham and Locke 1991). In addition, as transformational leaders involve followers, they also develop a deeper understanding of organizational tasks and affordances, and may better see how the specific goals contribute to the big picture they long for. By this means, goals also become more important.

Yet, leaders may also increase the importance of goals by their mere assignment due to the legitimate authority they have (Locke and Latham 2002). It has been reasoned that if leaders do not actively refuse the goals they are confronted with, they accept these goals and are motivated to pursue them (Latham and Locke 1991). Besides being authority figures, transformational leaders

are also role models, to which followers feel attached and with whom they personally identify (Steinmann et al. 2020). Followers admire these leaders, deeply appreciate what they do and say, and try to resemble them. Therefore, what these leaders consider significant also becomes significant for their followers. Accordingly, in the case of transformational leadership goal importance evolves from the leader's authority but also from identification processes.

**Transformational Leadership and Goal Attainability** Transformational leaders are equally able to boost followers' perceptions of a goal's attainability (e.g., Steinmann et al. 2018). The delegation of responsibility and the setting of challenging goals implies that transformational leaders consider their followers capable of reaching the standards they set (Latham and Locke 1991). They stimulate followers to question old ways of working and to break new grounds in achieving the team's goals. They are convinced of their followers' ability to contribute to the attainment of the higher-order vision and express confidence in their competencies (Yukl and Gardner 2019). Through these empowering leadership behaviors, transformational leaders create a general feeling of self-confidence and self-esteem, which positively impacts followers' goal-related self-efficacy and their attainability perceptions (cf. Ilies et al. 2006).

The intellectual stimulation of transformational leaders also helps followers to actually develop new abilities in analyzing and solving problems, which improve their goal pursuit and contribute to their success at work (Bass 1985). Improvements directly affect followers efficacy perceptions (Ilies et al. 2006). Followers further become aware of new procedures and methods for accomplishing their tasks as transformational leaders involve them in strategic considerations (Latham and Locke 1991). If they better understand the interplay of various proximal goals and how they relate to a targeted end-state, they might come up with new and more effective ways of approaching these goals. Moreover, transformational leaders also model the successful

attainment of goals so that followers learn certain procedures and behaviors through vicarious learning (cf. Shamir et al. 1993). As transformational leaders also provide instrumental support in the form of necessary resources, relevant information, or assistance on difficult tasks, their followers may achieve proximal goals during their progress toward the attainment of the far-reaching vision (Locke and Latham 2002). Distance to the desired future end-state diminishes gradually. This mastery experience, in turn, enhances followers' self-efficacy beliefs (Locke and Latham 2002). They build confidence in their ability to also attain more difficult or distant goals (Latham and Locke 1991).

Finally, transformational leaders are individually considerate about their followers and know their strengths and doubts (Bass 1985). They act as their coaches and therefore facilitate situations in which followers perceive a sense of control, competence and ability to cope (Shamir et al. 1993). As such, they may purposefully delegate those tasks, which help followers to develop personally and professionally, and increase their independence and empowerment that way (Bass 1985). Yet, they also provide social support. Especially in the case of failures, the leaders' appreciation and care may buffer any potential detrimental effects on followers' self-esteem or attainability perceptions.

## The Interplay of Vision Articulation and Goal Setting

Visions and goals are both cognitive and target-oriented concepts, which consider the discrepancy between a current and a compelling future end-state and which inspire goal-directed behavior (Kirkpatrick and Locke 1996). Yet, they differ with regard to their specificity, their focus and their timeframe. Although attributes of visions contradict those of effective goals according to the goal setting theory, abstract visions may also increase followers' performance (e.g., Kirkpatrick and Lowe 1996). Instead of assuming a mediating effect of goal setting in the vision-performance

relationship, more recent studies investigate the way both concepts may interplay. Drawing on construal level theory of psychological distance (Trope and Liberman 2010), Berson et al. (2015) suggest that the effectiveness of goals vs. visions might depend on the psychological distance between leaders and followers: Visions with their high hypothetical and temporally distant character should be more powerful to motivate followers if leaders and followers are socially and spatially distant. Concrete and time-constrained goals, by contrast, are meant to be the better motivator if leaders are socially and spatially close (Berson et al. 2015). In order to exert its full motivational potential, the level of abstractness vs. concreteness of the end-state thus needs to fit the level of psychological distance vs. proximity between leaders and followers. Van Houwelingen et al. (2017) further explained that in situations of low psychological distance to their leaders, followers rather attend to situational cues and concentrate on the feasibility of the end-state highlighted in the process of goal setting. In situations of high psychological distance, followers may rather consider what they want to achieve, as emphasized by the desirability of the abstract vision. Experimental studies support these assumptions (van Houwelingen et al. 2017). Rather than investigating the differential effectiveness of visions and goals across situations, a recent study (Gochmann et al. 2022) suggests that the effectiveness of a vision depends on the transformational leaders' goal setting behavior. Only if the specific goals, transformational leaders set to guide their followers' actions, are aligned with the values in the vision they communicate, they act in accordance with what they preach. This alignment of words and deeds is important for followers' perception of the leaders' behavioral integrity and their effectiveness in leading (Gochmann et al. 2022).

In sum, current research in the field of leadership thus suggests that leader behaviors related to vision communication and goal setting may indeed complement one another in elevating followers' motivation and increasing their performance beyond expectations.

## Introduction

Trolling is an intentional, instrumental, exploitative online interaction in which one user acts – usually negatively – at another’s expense (Cook 2021). Examples of trolling include posting fake product reviews on a website, posting inflammatory statements on a public forum to provoke discord, and posting a bait-and-switch – for instance, promising a Pokémon video in a video title and instead presenting a Rick Astley music video when a person clicks the link to watch. It ranges from the benign to the malicious, and has been explained by personality factors (Buckels et al. 2014), online environment, and social factors (Cook 2021). The present chapter provides 1) basic definitional criteria to determine if something is trolling or not, 2) differences between trolling and other similar online interaction types, and 3) a brief overview of business’ responsibilities when it comes to trolling and current practices for dealing with trolling in cyberspace.

## Trolling As a Negative Online Interaction

### Defining Trolling

To understand trolling, it is important to first know that its exact definition is an ongoing debate (Cook 2021). There are elements like deception, for instance, that appear in some definitions, but not others (e.g., Buckels et al. 2014). Trolling also exists across multiple platforms, such as online games, social media, and news websites, to name a few, further complicating the definition (Cook 2021). There are, however, a few common themes that emerge across definitions and study results, irrespective of platform: instrumentality, intentionality, and exploitation. Although this is not an exhaustive list of everything that can be a part of trolling, these elements are consistent across definitions made on myriad platforms using a variety of populations, and are thus the elements that are most likely to be generalizable across all trolls everywhere (Cook 2021).

The principle of instrumentality dictates that trolls do what they do for a reason, even if that reason is as abstract as personal entertainment or

as concrete as gatekeeping in a community (Cook 2021). In the case of certain political trolls, such as the Russian trolls – often scripted “bots” – this motivation could be patriotism or payment (Zannettou et al. 2019), while in the case of online gamers, it could be sadistic glee from frustrating newer players, or even just something to do to alleviate day-to-day boredom (Thacker and Griffiths 2012). There is ample evidence to suggest that personality is an important factor to consider as well, meaning some people may be inherently more likely to troll than others (e.g., Buckels et al. 2014); however, when asked directly, trolls consistently have a goal for their behavior, a reason for doing what they do, however vague (Cook 2021).

The first principle is highly connected to the second common element, intentionality, which means that trolling is something performed on purpose (Cook 2021). Connected, instrumentality and intentionality mean that trolls have a specific goal in mind, and they enact certain behaviors to achieve that goal. This presents a problem with trolling research: access to the troll is rare, but critical to establish intent. Practically, this means that a lot of the trolling that businesses and academics alike deal with may not actually be trolling, but just behavior that is perceived as trolling by the offended person. It is also worth noting that neither the goal nor the motivation for trolling has to be negative. There are several documented cases of trolling being enacted to make people laugh, or to forge relationships (Cook 2021). However, one person’s idea of a joke may be another’s idea of severe insult (Thacker and Griffiths 2012). Thus education, or at the least explanation as to why the troll’s behavior was unacceptable, is necessary to prevent future perceived trolling (Cook 2021).

Finally, trolling always includes some degree of exploitation, be it of website mechanics or of a person (Cook 2021). In other words, trolling is never truly victimless; it occurs at the expense of some entity. This is particularly evident in trolling in games, where there is often a particular person who is being victimized, usually for their lack of knowledge regarding game lore or mechanics (Thacker and Griffiths 2012). It can also be seen

in the business context, where people write false reviews of products, discrediting the seller in the process (Sanfilippo et al. 2017). The impact on the victim can be more or less intense and harmful, and the result of the trolling can vary significantly from case to case given the variety of positive and negative motivations and goals trolls have (Cook 2021). For instance, teasing and online pranking between friends is sometimes referred to as “trolling,” but in this case, the victim is more or less voluntary. However, even if the intended victim is not hurt by the trolling, given the public nature of the internet, it is entirely possible that someone else may be, particularly if the trolling refers to any kind of vulnerable group (e.g., sexual orientation, racial minority, religious affiliation). This situation reinforces the need for education alongside punitive action when it comes to trolling, as the affair is often more complex than the simple perception of someone having said or done something offensive or annoying (Cook 2021).

### **Trolling Versus Other Negative Online Phenomena**

All that said, trolling is not the only type of negative online interaction in cyberspace, and especially when issues of social justice come into play, it can become important to distinguish between the various terms in use, both legally and colloquially. One of the most common behaviors associated with trolling is cyberbullying (Cook 2021), defined extensively by Vandebosch and van Cleemput (2008) with a list of definition criteria including the intent to cause harm and a power imbalance between the bully and their victim. Trolling, too, has this critical component of intent, and particularly in cases where senior members of a community troll new members, there is often a power imbalance between troll and victim too (Cook 2021; Thacker and Griffiths 2012). There are, however, important distinctions to be made between the two phenomena. First, and most concretely, cyberbullying has a criterion of repetition (Vandebosch and van Cleemput 2008) that trolling does not share; if something is considered cyberbullying, the behavior has to have happened more than once between the same victim and

perpetrator, while trolling can be a one-off or repeated event (Cook 2021). In addition, although not a specific definitional criterion, cyberbullying almost always happens between known others, meaning people who have met in person offline (Vandebosch and van Cleemput 2008). This is not the case with trolling, where more often than not, the victim and perpetrator are strangers (Cook 2021). As previously discussed, the question of perceived trolling has yet to be answered conclusively, at the time of writing, the victim’s sense of being trolled is not necessary to define something as trolling or otherwise, even if it is a criterion used by researchers who are unable to access the trolls they seek (Cook 2021). Thus, although similar, cyberbullying and trolling are distinct types of negative online behavior.

Cyberbullying and trolling are not, however, the only types of negative online behavior; toxicity is one such construct that has become very popular in both the media and academia, although it is rarely defined (e.g., Blackburn and Kwak 2014). In lieu of a definition, it is often described as simply negative online behavior. This means that, practically, anything that is ever perceived by a user as unacceptable or offensive could potentially be called online toxicity; it is a blanket term for all negative online interactions. It can be a useful term for policy-makers or platform owners who want to cover all bases when writing rules or guidelines, but is easily challenged when rules need to be enforced because it has no concrete definition. Finally, there is digital hate, or “cyberhate,” which functions much like toxicity in practice, but is actually defined as “online messages demeaning people on the basis of their race/ethnicity, gender, national origin, or sexual preference” (Lee-Won et al. 2020). This directly mirrors most definitions of hate speech, only with the addition of the digital component. Essentially, anything that can be called hate speech offline can be called cyberhate or digital hate online. Although trolling can involve elements of racism or sexism (Thacker and Griffiths 2012), if it escalates to the point of hate speech, it can no longer be called trolling, as it enters the realm of criminal behavior and should be called cybercrime. Trolling, though usually negative, and sharing

elements with cyberbullying and cyberhate, is not a crime at this time.

However, this distinction between cybercrime and trolling is confounded by the fact that the internet is, with a few notable exceptions, shared internationally, while laws are largely confined to national borders. Most of the literature on cybercrime focuses on either North America or Europe (e.g., Anderson et al. 2013), which also adds to the confusion surrounding what is and is not cybercrime. Finally, both technology and law evolve over time, which means that, fundamentally, the definition of cybercrime cannot remain static, and must change to keep up with changes in both its foundations. Consequently, the exact distinction between trolling and cybercrime must also change as new laws are drafted and new technologies emerge. The bottom line, though, remains the same: if it is criminally prosecutable, it is not trolling, but rather cybercrime.

### **Ethical Considerations in Dealing with Trolling**

That said, despite the lack of legal culpability in the case of trolling, users still hold platform owners and managers accountable for offensive content on their websites (Cook et al. 2021). People expect to be taken care of when they are on the internet, and trolling can violate that expectation if not dealt with both swiftly and transparently by online platform owners. It is also important to note that there are few age restrictions in place on the internet, which means that children are also at risk to being exposed to the more controversial types of trolling that can appear in social media or their online games (Thacker and Griffiths 2012), adding an additional ethical consideration for platform owners and online businesses. Thus, even as laws and technologies change, even in the absence of a legal imperative, there is a moral responsibility on the part of these entities to protect their users (Cook et al. 2021), and there are several methods currently employed to that end.

Active content moderation is one such method, usually employed by social media platforms (Cook et al. 2021). Having either a volunteer or paid workforce removing content that has been deemed inappropriate, although post-hoc, can be an effective way to keep a platform “clean” of

trolling, particularly if the content moderators are transparent with users about how content is evaluated for appropriateness. Another option, taken by countries like China and India, is to get the government involved in approving content posted to the internet. This does, however, run the risk of confounding censorship and content moderation, and can be problematic in issues of free speech (Cook et al. 2021). Some websites also have a reporting function, a tool commonly used in online gaming that allows users to flag either posts or users as having acted against community regulations (Thacker and Griffiths 2012). This is sometimes used in conjunction with more proactive moderation techniques, sometimes separately as a stand-alone method. The common thread between all of these, however, is the necessity for clear guidelines for users regarding how to behave on the website in question. By using accurate, up-to-date terminology in their guidelines and by being transparent in their expectations of users’ online behavior, platforms can actively contribute toward the reduction of negative trolling on the internet while simultaneously protecting their own interests and their users’ (e.g., Cook 2021; Cook et al. 2021).

## Trust and Institutions

Reinhard Bachmann  
School of Finance and Management & Centre for  
Trust Research (CTR), SOAS, University of  
London, London, UK

## Introduction

The role of institutions in the development, maintenance, or repair of trust has been somewhat neglected by many trust researchers who have looked at the phenomenon in a narrowly focused psychological perspective. In this strand of the literature, institutions are often conceptualized as

external factors which only have a marginal influence on the quality of social relationships. In this disciplinary view, institutions are neither considered as potential objects of trust nor have they been acknowledged as a constitutive part of a relationship between two actors.

Many trust researchers' relative ignorance of institutions also has to do with the fact that these are difficult to come to grips with because the elements of, for example, a country-specific institutional framework are numerous and tend to be fuzzy and overlapping. Thus, even when the more sociologically grounded trust research looks at macro-level factors and contexts of relationships it is inevitably confronted with significant methodological problems. These emerge when empirical research is to examine a given institutional framework as the object of trust or to systematically include the various institutional influences that can deeply affect the development of trust between two or more individual actors.

The question that is frequently asked is as follows: How can institutions be measured? Although not everything in the social world is "measurable" in the strict sense, this question, nonetheless, deserves to be taken seriously as it points to the fact that significant validity problems can easily occur when institutional arrangements are empirically investigated. This seems to be simply owed to the complexity of institutional frameworks and not so much depend on which methodological and epistemological approaches one might favor.

Despite such difficulties, trust researchers have managed to provide at least some key insights into the role of institutions in the context of trust processes. Zucker (1986) and Luhmann (1979) are seminal approaches to understanding institutional influences on trust. Bachmann and Inkpen (2011) and Kroeger (2012) are newer contributions which try to shed light on issues related to the phenomenon of institutional(-based) trust. In the following, major issues in the current debate on institutional trust will be discussed and an overview of where the literature on trust and institutions stands will be provided, acknowledging the fact that a number of issues are, and perhaps will remain, controversial in this research field.

## The Object of Trust

Institutional(-based) trust can be defined as “a form of individual or collective action that is constitutively embedded in the institutional environment in which a relationship is placed, building on favourable assumptions about the trustee’s future behaviour vis-à-vis such conditions” (Bachmann and Inkpen (2011: 284). This definition suggests using this term for trust that people have in each other in the face of institutional safeguards, and it does not denote trust that individuals may have in institutional arrangements.

It is useful to analytically be clear about what the object of trust is, namely an institutional arrangement itself or another social actor’s behavior which is constitutively shaped by its embeddedness in specific institutional arrangements. Admittedly, however, it is often difficult to make this distinction by drawing a clear line.

Even the trustor themselves may find it difficult to tell whether he or she trusts a trained and competent individual, for example, a physician, or – in this case – the medical system including its educational traditions, university curricula and exams, or the national medical association which medical experts have gone through or been checked by before they receive a license to treat patients (Bachmann 1998). In the first case, institutions are seen as a framework within which relationships between two actors take on a specific quality, one of the actors (i.e., the trustee) being the object of trust. In the latter case, the object of trust is a complex system of institutional arrangements or an organizational entity, where a set of institutionalized rules are emanating from, and underpinned by, the power and reliability of the relevant arrangements.

Different from, but related to, the concept of “institutional(-based) trust” is “generalized trust” (Uslaner 2014). The latter is usually described as a form of social capital that is rooted in cultural traditions as well as specific institutional arrangements. Fukuyama (1995) and many other scholars suggest that this form of trust is best captured at the societal level and that it has a vital function with regard to stimulating growth and innovation in countries and geographic regions. The concept of “generalized trust” does not necessarily

(directly) refer to the quality of inter-personal relationships or specific institutional arrangements as an object of trust. It is rather seen as a societal resource and in many ways regarded as similar to “institutional(-based) trust.” The difference, however, is that it is more open to all kinds of sources of trust and not specifically targeting or building on institutional arrangements.

## Institutional(-Based) Trust as Trust in Institutions

“Trust in institutions” refers to a situation where a specific individual who represents the police, the national education system, legal courts, etc. is actually not the object of trust. If this actor, for example, does his or her job poorly and thus is replaced by another individual to perform the same role, this would not normally significantly affect the trustor’s attitude toward the institution that stands or stood behind the unreliable individual. In this case, trust is directed more to the institution itself rather than the individual actor who represents it. In other words, if a trustor’s belief in the functioning of social systems, irrespective of whether they will appear as abstract sets of rules or more concrete organizational structures, will not really be compromised by a single individual who does not live up to the trustor’s expectations, “trust in institutions” is present.

Trust in institutions can, just like trust in an individual actor, build on the trustor’s repeated experiences in interaction with the trustee, but it can also be deeply embedded in abstract cultural, political, and ideological worldviews which are not backed by any experiential basis. This, for example, leads individuals to trust foreign countries’ institutions less than their native countries’ ones and to invariably prefer to take serious conflicts with international business partners to a court in their home country. This shows that the psychic distance people have to relevant institutions is often much more influenced by cultural traditions and collective beliefs than by empirically verifiable observations and experiences.

However, individual representatives of abstract social systems are not irrelevant and have an

important function for producing and reproducing trust in institutions. Role fulfillment and rule following behavior of human beings who can be touched and one can talk to need to appear occasionally in order to assure trustors that there are well-trained and responsible real actors who are in control of the social systems which affect their well-being or even life chances. Giddens (1990) calls it “face-work” where individual representatives of institutions take this role. He argues that subsystems of modern societies which build on highly differentiated expert knowledge, e.g., health care systems, research and development departments of automobile manufacturers, or the global financial system, depend on the existence of human control and people who at least once in a while become visible to lay people to underpin complex institutions’ trustworthiness. Only under these circumstance, Giddens (1990) argues, highly complex expert systems can be “re-embedded” at the level of very concrete and practical interaction between individuals. Only this process allows depersonalized institutional arrangements to actually become the object of trust.

The term “institutional(-based) trust,” in this perspective, concerns the trust that social actors may have in systemic patterns of collective action or organizational structures. This form of trust is often examined by way of large-scale surveys, such as the Edelman Barometer (2016). These surveys tend to follow a longitudinal and comparative approach and try to measure changes in the public’s trust in media, law courts, governments, and other institutions over time in various parts of the world.

### **Institutional(-Based) Trust as Trust Between Actors *in the Face of* Strong and Reliable Institutions**

The term “institutional trust(-based)” often also denotes trust between two individual actors whose interaction is rooted in institutional arrangements that deeply influence their behavior. Where this concept of “institutional(-based)trust” is evoked, the underlying understanding is that an

individual actor trusts another actor in the face of the specific quality of an institutional environment which constitutively contributes to individuals’ decisions and behavior.

In order to unravel how institutions precisely can influence trust development, it seems useful to compare the arrangements leading to institutional (-based) trust between two or more actors to a situation where inter-personal trust prevails, i.e. trust between two individual actors that emerges in their relationship without institutional arrangements playing a significant role, and personal experiences that actors have with each other being essential. These constellations exist, for example, in private and intimate relationships, and they are what those trust researchers seem to have in mind who tend to ignore institutions and predominantly focus on the psychological aspects and dynamics of a trust-based relationship. As opposed to institutional(-based) trust, such forms of trust have been described as “inter-personal” or “interaction-based” trust.

The latter form of trust is dependent on both parties establishing some common ground between them. If there is no shared knowledge at all, it is simply impossible that trust can develop. However, if the two actors discover shared personal characteristics or learn about each other’s behavioral preferences by way of repeated interaction, “characteristic-based” trust or “process-based trust” – to use Zucker’s (1986) terminology – can be developed. Both parties need to be able to draw on a “world-in-common” in order to create trust. The latter is a precondition to building trust between two actors because only this allows the trustor and the trustee to make grounded assumptions about each other’s intentions, expectations, and future behavior.

Analogously, institutional arrangements can be seen as functional equivalents to face-to-face experiences or, for example, a similar ethnic background. In other words, institutions do essentially the same job as shared ascriptive personal characteristics or positive experiences in interacting with another actor. If a potential trustor and a potential trustee know that their sense-making of a specific situation is embedded in and shaped by the same institutional environment – consisting of legal

norms, standards of academic or vocational education, social and cultural rules about what is acceptable social behavior, etc. – institutions will tacitly mold and align actors' mutual expectations of their future behaviors (Bachmann 2001). Thus, institutions can generate and maintain the common ground that is an essential precondition for the development of trust, just as shared ascriptive characteristics or repeated experiences do in the case of inter-personal trust.

Legal norms and technical standards, industry associations, or quality certification systems are examples of institutional arrangements which can assure actors that they have a shared understanding of what is "common practice" and what is expected behavior in specific situations. From a potential trustor's point of view, this reduces the risk that his or her trust is misplaced and, thus, encourages them to actually invest trust in a relationship. The reduction of risk – or risk perception, to be precise – can be achieved by establishing a social environment in which relationships between actors are systematically embedded. This facilitates trust which otherwise two actors might not be able to create.

Irrespective of the safeguards that may exist, any potential trustor is confronted with the problem that he or she needs to accept a certain level of risk. This is indeed inevitable because trust will not occur nor is it needed if there is no risk at all. But a potential trustor will always be keen to at least roughly assess the risk that comes with his or her decision to invest trust in a relationship. And this is exactly the point where past experiences, ascriptive personal characteristics of the potential trustee, and institutions become relevant and indeed appear to be very similar in functional terms. They reduce risk to a level where the "leap of faith" (Möllering 2006) seems possible or even a good behavioral choice for the trustor. This is how institutions influence the behavior of individual actors, and it explains why they can play such an important role in trust development processes.

In principle, there are two strands of literature, which build on different epistemological premises

and make divergent assumptions on how, for example, reliable courts and pervasive legal norms can exert their influence on a potential trustor's behavior. First, actors make a rational decision, and possible sanctions emanating from legal regulation are considered as one variable among others in their calculations. If this variable reaches – *ceteris paribus* – a value over a certain threshold, for example, in terms of the maximum of damage caused by possible sanctions, this is predicted to discourage potential trustors to actually invest trust in a relationship. Vice versa, where the value is below this threshold, it encourages the potential trustor to invest trust in a relationship. The underlying assumption is that the trustee will then be more likely to behave trustworthily as he or she will fear legal sanctions that might be mobilized against them. This perspective is deeply rooted in positivistic premises as upheld by Rational Choice Theory (Coleman 1990).

The problem with this approach that is it is questionable whether the prosed conceptualization of trust has actually much to do with what trust is all about. Coleman (1990) suggests viewing the trustor as if he or she was placing a bet, for example, on a racehorse. The difference between trustors and bettors, however, is that the latter do not deal with fuzzy knowledge whereas a trustor does precisely this. A bettor has exact information on the odds and amount of money he or she can lose or win. This does indeed allow for a purely calculative risk assessment. However, where this is possible, one might argue, there is neither room nor any need for trust. Trust, by contrast, has its place, exactly where rational decisions are not possible because the available knowledge is fuzzy and diffuse.

Second, a different and perhaps more realistic strand of literature offers a conceptual grip on how institutions may influence individual behavior on the basis of phenomenological premises. New Institutional Theory (Powell and DiMaggio 1991), Structuration Theory (Giddens 1984), and Systems Theory (Luhmann 1979) are good examples here. In this perspective, institutional arrangements only bundle and channel the

behaviors of actors such as potential trustors in a certain direction. For example, legal norms are not seen to be controlling rational actors' behavior by way of fear of sanctions; a large number of semi-conscious individuals' behaviors are molded and drawn to share assumptions if institutions work effectively. Institutions are not a variable in an explicit and fully rational decision-making process. Legal norms and social norms alike are grounded in institutional arrangements that usually remain latent and influence actors who tend to make their decisions semi-conscious (Luhmann 1979). This perspective may indeed be much closer to empirically observable human behavior than the calculation-based approach advocated by Rational Choice Theory.

## Conclusion

There are different ways to explain how institutions precisely do their job with regard to trust building and maintaining. While some scholars suggest that calculative considerations are underlying trust decisions, a major part of the trust research community connects to phenomenological traditions of epistemological and theoretical thought. Only where trust is viewed as a merely psychological phenomenon, institutional arrangements are seen as more or less negligible, and the functioning of larger social systems will remain unexplained.

Advanced socioeconomic systems need to coordinate individual actors' expectations and interaction. They either draw on strong institutional arrangements, to generate institutional (-based) trust, or indeed need to fall back on other social coordination mechanism, such as power or monetary incentive systems, to fulfill this function. There are certainly also dark sides of institutional(-based) trust. Too much of it can reduce competition and incentives for individuals to strive for creativity and innovation. On the whole, however, institutional(-based) trust is a very valuable and, in many cases, scarce resource which socioeconomic systems need to draw on in order to save transaction costs and encourage

economic innovation and performance (Zaheer et al. 1998).

## Trust and Value-Based Management and Leadership

Robert A. Scott  
Adelphi University, Garden City, NY, USA

### Introduction

Management and leadership<sup>1</sup> experts generally agree that trust is an essential element of corporate culture and governance in order to ensure the loyalty of employees, customers, shareholders, neighbors, and other stakeholders. This is true whether the corporation is a business, a university, a hospital, or a charitable organization.

Value-based management is a term that has two quite different meanings, but each assumes a level of trust to be fulfilled.

### What Is Trust?

“Trust” is the belief in the reliability, truthfulness, and certainty of another person. When there is trust, we can have confidence in the word and pledge of a boss, coworker, or employee. In the words of Charles James Fox in 1785, “the right of governing was not property but a trust.” Trust is based on a compact or covenant between parties that is bound by the word or pledge of each one. Trust does not require a signed document. With trust, each person is expected to be reliable. The manifestations of trust are mutual respect, the ability to disagree without being disagreeable,

and the belief that one can be right without the other being wrong.

In employment matters, trust means that members of the group can assume that their security, safety, and well-being will be honored, that no superior or subordinate will either malign or demean them. In terms of corporate governance, trust means that the board can rely on management to be transparent about business strategies, algorithm assumptions, and compliance with government regulations.

### What Is Value-Based?

Value-based management or leadership is the term used to describe the relationship between organizational goals and employees’ personal values. Managers and leaders communicate the values expected in executing corporate strategies for achieving goals. These include honesty and a sense of corporate social responsibility, assuming that employees will find a personal commitment to the company’s mission and goals. By focusing on core values, such as openness to new ideas, commitment to environmental sustainability, honoring diversity, encouraging opportunities for growth, assuring customer satisfaction, etc., managers and leaders can expect to inspire employees to believe in the sincerity of the organization.

In a value-based organization, there is a culture of conscience in decision-making, not just a commitment to legal compliance. A value-based organization is one in which one should expect few surprises and no iconic figures who are beyond question.

The value-based organization is one that is principled, not *ad hoc* in its relationships, and neither manipulative nor disrespectful in relations.

### What Is Value-Based Management and Leadership?

With this understanding of the terms “trust” and “value-based,” what can we say about value-based management (VBM)? VBM requires consistency in the approach to setting a mission,

---

<sup>1</sup> By leadership, I mean the role that expresses the vision to fulfill a mission and the overall strategies for achieving it. By management, I mean the role responsible for executing the strategies.

including the values that are fundamental to the organization; developing a theory of governance to oversee strategy and communication standards; promoting a corporate culture understandable to all; establishing an organization; formulating principles for decision-making, performance goals, and a reward system; and monitoring the processes and systems necessary to fulfill the strategies designed to fulfill the mission. This is the goal of strategic planning.

Strategic planning includes the following elements: (1) articulating the mission or purpose, as well as the values, of the institution; (2) identifying principles for decision-making that acknowledge the heritage and the mission of the organization; (3) setting priorities for action developed with consensus; (4) stating assumptions about the internal and external forces at work and clarifying alternative courses of action; (5) identifying the results desired and the resources needed; (6) articulating strategies for achieving goals; (7) noting the milestones and metrics for monitoring progress, knowing that some milestones are subjective and cannot be measured with numbers; and (8) ensuring that there are periods of time for reflection and a community-wide review of values, goals, and progress.

Values are of two types. The one most often referenced relates to “shareholder” value, i.e., assets, discounted future cash flows, and the like. This approach places share price, quarterly results against forecasts, and profitability as the highest values, even when the actions taken to achieve these goals may not be in the long-term interest of the corporation.

The second type is “stakeholder” value. This approach places responsibility for the mission, employees, customers, and communities over profitability, although profitability must be achieved. Some refer to this approach as corporate social responsibility or “triple bottom line,” i.e., taking into account the social impact, environmental impact, and financial impact of the corporation. In this case, finances are not ignored, but neither are the impacts on social institutions or the natural ecology. This approach to value results from a governance system that fosters a culture of conscience, i.e., behavior based on ethics, as

well as a culture of compliance, i.e., motivated by complying with laws and regulations to avoid sanctions.

The culture of conscience fosters open-mindedness, intellectual humility, moderation, civility, and respect. It requires management to operate on the basis of pragmatism instead of acting on “gut” instinct or some abstract ideology. The culture of the corporation should make compliance a matter of conscience. This is the responsibility of leadership as it fulfills the goals of the board and guides the actions of management.

There are four components of leadership (Scott 2018): listening, reading, speaking, and writing, and each is guided by values. Listening can mean seeking both formal and informal times to hear people comment on how things are going and what they wish could be improved. Leaders listen by walking the halls and pathways, attending events, and otherwise putting themselves in a position to hear from constituents. When listening, leaders pay attention; they do not just wait their turn to rebut what was said. Listening carefully also includes watching intently to pay attention to physical expressions, to acknowledge one’s partner, and to affirm what has been heard. Active listening requires memory as well as comprehension.

Another way to take in information, ideas, and inspiration is by reading. Leaders need to keep up with the news and informed opinion, they need to know about the latest technologies and developments in science, and they need to know what is happening in relevant areas of policy and practice. Leaders should read history in order to understand context, biographies to learn how others have faced challenges, and fiction and poetry to see imaginations soar and find new ways of refining their use of language and imagery. History, biography, and fiction, followed by reflection, are also good sources for leaders to find meaning in their own lives.

Leaders also express themselves through speech. Every leader gives speeches, talks, and welcoming comments to groups of all types and sizes. These are opportunities for leaders to express values, emphasize the unique features of the organization, and tell stories that illustrate how

the mission is being fulfilled. These stories become like fables, legends that illuminate the history and heritage of the organization. Every talk, whether spontaneous or prepared, whether short or long, should have a message beyond "Welcome." Each is an opportunity to broadcast the mission, vision, and unique nature of the corporation. Such speeches are usually more effective when they are authored and delivered with personal passion rather than scripted by a professional speechwriter.

Sometimes, speaking is in the form of a request for help. Leaders should not be afraid to do so. At other times, speaking is part of a negotiation on some issue. Such speaking may become compromise, but a compromise of position does not necessarily mean a compromise of principles. Indeed, compromises are often necessary for processes to work, even in business.

Finally, writing is an essential art for effective leadership. Many times leaders have come up through the ranks of accounting, marketing, or technology, and any writing undertaken was mostly for relatively narrow professional audiences that often have vocabularies of their own. Leaders should be encouraged to write for publication in more popular outlets as well as their professional journals. Writing op-ed pieces for the daily or weekly newspaper or an e-newsletter is good practice. It is a form of intellectual leadership, with the general public instead of a group of professional colleagues as the audience. Such writing can raise the profile of the organization as well as of the individual leader or manager.

### **What Are the Consequences of Trust and Value-Based Management and Leadership?**

The benefits of trust and value-based management and leadership may be found in the relations with employees, customers, the community, the shareholders, government agencies, and other stakeholders. If leaders and managers act with integrity, others are more likely to follow their lead. If they do not act ethically, their actions

may provide an incentive for others to act unethically too.

Think of the consequences for hiring talented staff and retaining them. If the environment at the organization is one of backbiting and competition, prospective employees many stay away and employee retention can be weakened. Prospective employees want to know about the culture as well as compensation and benefits. Will they fit in or will they find unbridled rivalry? Will they be able to maximize their chances for success or will the cultural climate induce fear?

Customers too are influenced by corporate conduct. If products (or services) are unsatisfactory, does the organization take responsibility or does it assert, in essence, let the buyer beware? If the district manager of a soap distribution company says he does not care if the products are "flushed down the toilet" as long as they are purchased, how will this influence the new salesperson under his tutelage?

The community and neighbors nearby to the organization care about its behavior too. How will they react if there is evidence of water or air pollution, or of fraudulent practices in employment or finances? They can seek revenge and retribution the next time the organization seeks local regulatory approval for a construction project or zoning change.

Shareholders want the value of their stock to increase and their dividends to be consistent. But they also want to be treated fairly, and not learn that management has taken actions that may increase the value of stock in the short term but limit the prospects of the company in the long term. They also want to know that management is being compensated fairly and is not engaging in financial manipulation that boosts profits to meet a quarterly target but is neither ethical nor legal.

State and local governments enact laws and regulations to protect the public from activities that can endanger it financially or in terms of health and safety. When the board and leaders of an organization allow practices that "over-ride" environmental regulations, or ignore reasonable and rational calculations of consequences, the governmental and public consequences can be

severe. It is the shareholders who lose most when companies must pay fines.

## Conclusion

When corporations of all kinds operate with a culture of conscience, and not just compliance, their behavior can engender the quality of trust that is needed to ensure the loyalty and even forbearance of employees, customers, shareholders, neighbors, and government regulators. Most management and leadership experts assume that “trust” is the value proposition necessary to inspire followers. While some leaders in some settings act as if “fear” is the better path to take, the evidence is that motivation by fear does not lead to trust or sustainable relationships.

Therefore, we can assume that trust is an important value for leaders and managers to convey, that value-based, or value-infused, management and leadership requires trust, and that value-based management and leadership are more effective than other means for guiding long-term strategies to achieve long-term goals.

## Truth and Ethics in Labor-Management Negotiations: The Accounting Information Behind the Scenes

Staci A. Kenno

Goodman School of Business, Brock University,  
St. Catharines, ON, Canada

## Synonyms

Collective Bargaining

## Introduction

Trust is an essential part of our lives, personally and professionally. Distrust in people or information can change the decisions that we make and can cause the lines to blur between ethical and unethical. This entry examines the ethicality and trust in the information used in labor management negotiations, specifically the accounting information. Distrust in the information and the ethicality of those providing it can hamper the use of accounting information and affect the relationships that drive the success (or otherwise) of the negotiations. From financial statements to management accounting data, financial information is critical to the outcome of negotiations. Can it be trusted?

Labor negotiations occur in many jurisdictions, organizations, and contexts. Although for convenience here, I will reference primarily the unionized context, the issues raised should be equally relevant in other contexts where labor freely negotiates wages with employers. Regardless of context the individuals involved are often the high-ranking executives in charge of the best interests of the company and union leadership or those who are responsible for representing the interests of employees. There are three elements that lead to the concluding discussion about their intersection; the labor-management negotiations context, the trust in relationships between company and union officials, and the accounting

numbers themselves. Each element involves different levels of truth and ethicality.

## Labor-Management Negotiations

Labor-management negotiations begin long before the first official discussion takes place between the union and the company. Information, financial and nonfinancial, is requested by the union well before the contract expires and that information is used to create the requests for wage or pension increases and additional benefits. Then when negotiations begin, there are presentations and discussions surrounding the changes to be made to the labor contract, often using accounting information as a basis for the debates that follow.

Negotiations historically have been about getting as much as possible for each side. When unions were at the height of their strength in the mid-1900s, they were often successful in achieving a great deal for their membership, partially because there was a significant economic growth in most companies during that time and they were willing to spread the wealth. Throughout the following decades, into the early 2000s union membership in North America was declining and the companies were turning to their employees for concessions to their wage structure, pension allowances, and benefits. Particularly in a time of economic decline, it was argued by corporations that cuts were needed and it was not unusual for a company to turn to its employees for concessions. It is important to note this shift in requests, as this affects the relationships of those involved.

## Trust in Relationships

Trust is crucial to both the building and maintenance of any relationship (Cook et al. 2005). Along with credibility and reliability, relationships develop over time. There is often minimal trust in the relationship between the union and management individuals involved in negotiations, as they are constantly at odds over what's best for their respective "stakeholders." Lack of trust is not particularly new, and it is a common finding

across different organizations (Walton et al. 2000). Within labor-management negotiations, relationships are also often tested by the change of individuals involved or shifts in economic context, and it is trust in their relationships that is particularly important.

Within the context of labor-management relationships, trust (or lack of trust) in accounting information is particularly important. Information is not always being shared within negotiations, and when it is there can be significant skepticism about its veracity. It isn't a matter of whether it is or is not right, but whether people trust it. Not all numbers can be verified and this is an important contribution to the tension or mistrust in these labor relationships.

## Accounting Numbers

Financial data is an essential ingredient to rational business decisions therefore one would assume such data plays a major role in labor-management negotiations. Within the process of labor-management, negotiations is an exchange of information that often includes financial statements, management accounting estimates for labor cost per hour, future sales levels, new product lines, and future management plans. The information that is shared by management is often proprietary and confidential and there is minimal recourse for verifying the data by the union. There can be a constant debate as to whether these pieces of information that are being passed back and forth can be trusted. In preparing accounting data, there is a variety of different assumptions that can be used.

There are two different perspectives about the use of information within labor-management negotiations. One is that information is barely used within the context, suggesting that unions are relatively unsophisticated and unable to use the accounting information even if it is provided to them (Craig and Amernic 1997). The other more recent position argues that union leadership teaches itself how to use accounting information to its advantage (Kenno and Free 2017); that the accounting information is important to requests for changes in wages, pensions, and benefits.

This latter position lends itself to saying that accounting information can be paramount within negotiations and is the basis for requests of changes in the labor contract from both union and management.

Information provided by the company by its management may not always be faithfully represented, particularly accounting information (McBarnet et al. 1993; Waterhouse et al. 1993). Publicly available accounting information, including financial statements, has rules and standards that must be followed. Even though this information is typically audited by an independent source with public companies or can be recreated through applying accounting rules, these documents do not impact negotiations as often as internal information does. The internal information, or management accounting information, does not have particular standards or rules that must be followed. Without being able to recreate or confirm calculations of internal numbers, where does that leave those who are dependent on their ability to trust the truth of the information and the ethicality of those providing it? This can create significant issues of trust in the respective relationships.

## People, Accounting, and Negotiations

Trust is crucial to negotiations. Accounting is highly important. The problem for the latter, as was alluded to above, is that “accounting information is a malleable resource” (Ogden and Bougen 1985); accounting information may be changed often. There may even be disputes about the basic methodology behind the accounting calculations. Negotiations can break down over competing interpretations (Toms 1998) and give rise to arguments about trust and the ethicality of the individuals providing the accounting information.

The trust and ethicality of those involved are inexplicably tied together. If there is no trust in those with whom you are dealing, there may be no reliance on the information that they provide. As trust can be viewed as a continuum, relationships can shift back and forth, depending on the

circumstances but the foundation needs to be there. Trust is not implicitly placed in either the people involved or the accounting provided but is built and earned over time. The relationship in labor-management negotiations is just as important as the numbers. Negotiations can be won or lost with the numbers, but it can also be lost if an individual in the negotiations is deemed to be untrustworthy. Labor-management negotiations are a complicated set of discussions between company and union officials. Within these discussions, both accounting information and relationships are critical to successful outcomes.

## Conclusion

The effect of trust in individuals in a labor-management negotiation relationship extends to the information that is shared within that context. As labor-management negotiations are not a trivial part of any organization’s functions, the relationships and outcome of negotiations can play a substantial role in the future of the company. It is the combination of the people and the numbers that affects the level of trust within those relationships. Accounting information may play an integral part in the negotiations or it will be discarded as fundamentally untrustworthy.

## UN Guiding Principles and Transnational Business Governance

Karin Buhmann

Department of Management, Society and Communication and the Department of Law, Copenhagen Business School and the University of Southern Denmark, Frederiksberg, Denmark

### Synonyms

Business and Human Rights (BHR); Responsible business conduct; “Ruggie framework”; “Ruggie principles”; The corporate responsibility to respect human rights; Transnational law; UN (“Respect, Protect and Remedy”) Framework

### Introduction

The United Nations (UN) Guiding Principles on Business and Human Rights (UNGPs) are a soft-law instrument adopted by the UN Human Rights Council in 2008. The UNGPs set out three pillars: (1) the state duty to protect (human rights against business-related infringements), (2) the corporate responsibility to respect human rights, and (3) access to remedy (for victims of business-related human rights harm). The UNGPs apply in all states and to all types of businesses enterprises, including their transnational operations whether involving the

company itself or its business relations, such as supply chains. Transnational governance denotes governance that combines public and private actors, activities, and interests across national borders and territories. Spanning the public and private spheres and transnational business operations, the UNGPs constitute the leading instrument for transnational business governance with regard to human rights. They are also a prime example of a governance instrument developed upon request of a public international organization, with the aim of addressing governance gaps related to transnational business governance. Moreover, the UNGPs have lent inspiration to a number of other transnational business governance instruments, both public, private, and hybrid. In particular, the UNGPs’ elaboration of risk-based due diligence as a management process for companies to identify and manage harmful societal impacts has had a major impact on transnational business governance. This entry explains these concepts and the UNGPs through the following structure: the first section introduces the UNGPs. The second introduces transnational business governance. The third elaborates the significance of the UNGPs and key aspects of their contents and background in regard to transnational business governance. The final section sums up.

### The UNGPs

The United Nations (UN) Guiding Principles on Business and Human Rights (UNGPs) (UN 2011)

are a soft-law instrument adopted by the UN Human Rights Council in 2011. The UNGPs apply in all states and to all types of businesses enterprises, including their transnational operations whether involving the company itself or its business relations, such as supply chains. The UNGPs spell out operational steps based on an inherent connection between the private and the public aspects of preventing and managing human rights harm related to business activities. They do so around a structure of three “Pillars” of (1) the state duty to *protect* human rights against business-related human rights infringements, (2) the corporate responsibility to *respect* human rights, and (3) enhanced access to *remedy* for victims.

The UNGPs are the result of an three-year study at the request of the UN Secretary-General, following a previous three-year study, the so-called “UN Framework” report with the long title: UN “Respect, Protect and Remedy” Framework (UN 2008) that in addition to the structure of the pillars proposed several key concepts in Business and Human Rights (BHR) that are elaborated and operationalized by the UNGPs. The UNGPs and UN Framework do not create new human rights or obligations, but explain the implications of existing human rights standards for states and companies with regard to business-related human rights impacts.

Based on requests and terms of reference (so-called “mandates”) from the UN’s political human rights bodies, both studies were charged on professor John Ruggie, a political scientist who had previously worked as Assistant UN Secretary-General and in that capacity had played a major part in the development of the UN Global Compact. Like the UN Framework, the UNGPs were developed through multistakeholder processes involving business organizations, intergovernmental organizations, state representatives, civil society, and academics. A request for such an inclusive multistakeholder process was set out in the mandate that governed the work towards the reports.

The UNGPs are sometimes referred to as the “Ruggie Principles.” However, since they were developed as a task set up by the UN Secretary-

General, and moreover were adopted by the UN Human Rights Council in 2011, they are correctly referenced as the *UN Guiding Principles*. (Similarly, the UN “Respect, Protect and Remedy” Framework report that preceded the UNGPs, which is sometimes referred to as the “Ruggie Framework,” is correctly referenced the *UN Framework*.)

Pillar 1, *the state duty to protect* is based on the idea of “horizontal” human rights obligation of states. This means that they must protect individuals or communities against human rights abuses by third parties (such as companies). They should do so through policies, regulation, monitoring, and enforcement. As part of this, states may issue guidance to companies, for example, on human rights due diligence (HRDD) as a process for companies to prevent and manage human rights risks. States are also encouraged to recommend or require specific actions by companies, for example, reporting on their human rights impacts and their HRDD processes.

Pillar 2, *the corporate responsibility to respect*, is based on recognition that societies and stakeholders expect firms not only to comply with domestic law but, where it is inadequate or even conflicts with accepted human rights standards, to go beyond it by respecting international human rights law. Companies should as a minimum respect the rights set out in the so-called International Bill of Human Rights (comprising the Universal Declaration of Human Rights, the International Covenant on Economic, Social and Cultural Rights, and the International Covenant on Civil and Political Rights) and the core labor standards set out by the International Labour Organisation (ILO)’s fundamental conventions (the elimination of child labor, the abolition of slavery and forced labor; the right to form and join trade unions and engage in collective negotiations; and the freedom from discrimination in employment). This corresponds to the commitments that members of the UN Global Compact undertake in regard to the Compact’s Principles 1–2 on human rights and 3–6 on labor standards. However, the UNGPs set out much more detailed guidance for companies to respect human rights

than what is provided by the Global Compact principles.

In particular and as one of its the major contributions to transnational business governance, the UNGPs spell out the steps that companies should undertake as part of their human rights due diligence. A management process related to other forms of risk-management, HRDD was proposed by the UN Framework. The UNGPs elaborate the actions that companies should take to identify risks of business related adverse human rights impact, to prevent such impact, to mitigate impact that has already occurred, and to remedy damage done. By contrast to some other risk-management processes that focus on preventing and managing risks to the company (including financial and legal liability due diligence), HRDD is first and foremost directed at risk to society. Naturally, when a company carefully exercises HRDD to identify and manage societal harm that it may be involved in, it may also help prevent harm to itself, for example, by reducing loss of social license to operate. HRDD is an ongoing process that should begin when a new project or idea is conceived and only ends when the project and its impacts are fully over. Assessments of impacts should be regularly revisited as human rights impact are dynamic and may be influenced by other events.

Moreover, companies should adopt a human rights policy (supported by the highest management level in order to ensure its effectiveness throughout the organization), and they should engage in providing remedy when human rights harm occurs (or is seen to occur) despite policy commitments and the exercise of human rights due diligence.

Pillar 3, enhanced *access to remedy* for victims of business related human rights abuse, sets out that remedy should not only be offered by state institutions but also established within a business context (“operational level”). Remedy entails both a complaint (or grievance) handling institution and compensation, which must be appropriate and specific to the culture and context in which it applies. Operational-level remedy is intended to help identify and address potential or actual human rights harm early on and to provide fast and often simpler access than what is often

possible through remedy offered by state institutions. Operational level remedy does not rule out the significance of victims having access to courts or other state-based remedy institutions.

By contrast to some strategic business management theories on the business case or the creation of shared valued, the UNGPs insist that business enterprises must respect human rights and engage in processes to identify and manage potential or actual harm, whether or not they see strategic advantages in doing so.

## Transnational Business Governance

From an institutional perspective, governance actors and competences are typically delimited by the public or the private spheres. Moreover, governance, in particular public governance, at the national level is generally delimited by territorial boundaries, which define the reach of legislative and judicial competences of nation states. National boundaries also set limits to the reach of private governance because it is by default subject to public law within the territory of each nation state. At the international level, the governance of international business encounters particular challenges. International law is not only made by states, but also traditionally *for* states. This does not mean that international law cannot address the private sector: in principle, international law can be made to address the private sector, provided the political will by states to adopt such law. In practice, an absence of political agreement has been a major impediment to international regulation of business with regard to responsibilities for their impacts on society. This stands in marked contrast to agreements at the international level and by regional organizations to adopt trade agreements that enhanced the economic rights and opportunities of business during the second half the twentieth century and the first decades of the twenty-first century (Ruggie 2013).

As a response to this situation which led to companies de facto being able to benefit from national and international governance gaps in regard to a balance between economic rights and societal duties, various actors have sought to

enhance the governance of business enterprises and their transnational activities. Several such initiatives launched by non-state actors (such as business associations, sector organizations, and/or civil society) emerged in the late twentieth century. Being initiated by non-state actors and addressing the private sector, these are referred to as private business governance.

Transnational governance exceeds the limits of the private and the public spheres by reaching into both, and connecting both, and by applying across national borders. Transnational governance can evolve through multistakeholder initiatives. There is not absolute agreement in the literature on whether or not transnational business governance by default must involve the public sector as a regulator (Eberlein et al. 2014), but most definitions of transnational governance assume a regulatory role to be played by public organizations (Zumbansen 2012; Koh 1997). Such organizations range from national governments to regional and international organizations, such as the UN. In order to make a meaningful distinction between purely private governance and purely public governance and to discuss the UNGPs as an example of transnational business governance, this chapter defines transnational business governance as involving one or more public organizations, typically in a regulatory capacity, and applying to private actors in regard to their transnational conduct. This does not exclude private sector participation in the regulatory process; nor does it exclude public actors from being covered by the resulting standards of conduct. As evidenced by the UN Global Compact, launched by the (then) Secretary-General of the UN, which is the world's largest international organization whose members comprise most of the world's states, public organizations can play a major role for the evolution of transnational business governance schemes aiming to reduce harmful business-related societal impacts. With the adoption of the UN *Protect, Respect and Remedy* Framework in 2008 and its operationalization through the 2011 UNGPs, the transnational regulation of business impact on society has undergone significant further evolution.

Besides being an example of transnational business governance in a broad sense (Buhmann 2015), the UNGPs can be considered an example of transnational soft law. Like transnational business governance in the broad sense, transnational law applies to or involves public and private actors, often of an international, respectively, multinational character and also often operates across the boundaries of national or regional legal systems. Transnational law merges elements of conventional public (international, regional, and sometimes even national) law and conventional private law as well as new forms of law and rule-making, including private self-regulation, such as corporate or sector-wise codes of conduct for companies with transnational operations (Zumbansen 2012; Koh 1997).

Territorial and political limitations of national and international public law reduce the possibilities of public regulators to regulate transnational business conduct directly. However, territorial limitations on the applicability of public law need not cause a government or authority to be without a role in regulating business conduct. Governments not only engage in shaping business conduct through instruments guiding firms. To the political scientist, the limited reach of national law beyond national boundaries and the limited enforcement of international law may speak to an absence of the state and irrelevance of the law. Yet the international law scholar notes that because international law enforcement institutions are generally weak, the distinction between “hard” and “soft” international law is often of limited significance for practical purposes. International lawyers may argue that what matters in a system lacking strong enforcement mechanisms is whether a rule has a “compliance pull” generating respect based on voluntary acceptance on norms being perceived as legitimate in the sense that they are seen as reasonable and worth following (Franck 1990). From this perspective, the multi-stakeholder approach that led to agreement on the UNGPs (and the UN Framework) may be what can help drive such a compliance pull, at least for companies that understand the ethical, economic, and social license implications of understanding and managing their human rights impacts. In

practice, this is complemented by operational and state-based remedy institutions (Ruggie 2013; Buhmann 2015).

The emergence of transnational business governance of is largely a result of the fact that markets have internationalized while governments remain by definition bound by their borders. Norm-setting by international organizations becomes transnationalized when it relates to issues that used to be subject to private or national regulation, often in an effort to remedy governance gaps resulting from the inability by national legal systems to adequately regulate transnational business and its social impact. International organizations like the UN and the Organisation for Economic Cooperation and Development (OECD) have been active in set norms of conduct for transnational business operations. After a jump start in the late 1970s with soft-law instruments adopted by the OECD and the International Labour Organisation (ILO), norm-setting for transnational business operations by public international organizations slowed down due to various disagreements among states and non-state actors. Following a series of private efforts at governing business operations with regard to corporate social responsibility (CSR), renewed efforts emerged in the late 1990s. Concern with the harmful human rights impacts of business led to transnational business governance focused on human and labor rights. The UNGPs emerged out of these efforts. The UNGPs build on conventional international law (human rights law) but go beyond this in seeking to regulate business conduct across territorial borders in an effort to address governance gaps leading to business-related human rights abuse.

### Significance of the UNGPs for Transnational Business Governance

The UNGPs are currently the most comprehensive and recent instrument offering guidance on how businesses enterprises should respect human rights and how states should support those actions. Negotiations that have been going on with the UN since 2014 towards a potential

international treaty on business and human rights take many of their cues from the UNGPs. The treaty process currently looks set to develop obligations for states to support the implementation of the UNGP's ideals, but not to result in direct obligations for companies.

The UNGPs have had a major influence on several other instruments of transnational business governance as well as CSR normativity in a broader sense. In particular, several other organizations have adopted the approach of HRDD as a management process for enterprises to identify and manage their societal harm. In several cases, this has been expanded to cover environmental and other societal impacts. For example, this applies to emergent legislation from the European Union (EU) and guidance from the Organisation for Economic Cooperation and Development (OECD) in regard to guidance on what these organizations refer to as *responsible business conduct* (RBC). Similarly, the International Standardisation Organisation's (ISO) 26000 Guidance Standard on Social Responsibility applies the UNGPs' risk-based due diligence approach, and the UN Global Compact references the UNGPs and therefore their comprehensive guidance. Notably, the implementation provisions of Agenda 2030 under its provisions on the role of business for the Sustainable Development Goals (SDGs) include an explicit reference to the UNGPs (UN 2015, para 67). This means that in their efforts to deliver on sustainable development as set out by the 17 SDGs, businesses as well as governments should ensure observance of the UNGPs and the operational steps that the UNGPs set forth. In other words, Agenda 2030 calls on states and the private sector to ensure that businesses respect human rights in accordance with the UNGPs when they engage in contributing to fulfillment of the specific SDG objectives.

### Conclusion

Drawing on the UN "Respect, Protect and Remedy" Framework, the UNGPs address business-related human rights abuse. The UNGP take their cue from the "*do-no-harm*" focus of the UN

Framework and elaborate on the operational steps out by that report for companies to identify and manage adverse impacts, and for governments to support this. Some of those steps, in particular, the risk-based (human rights) due diligence approach, have been taken up by other transnational governance instruments, such as ISO's 26000 Social Responsibility Guidance Standard and the 2011 update of OECD's Guidelines for Multinational Enterprises, broadening the scope and application beyond human and labor rights to environment, bribery and other issues and underscoring the do-no-harm imperative. Accordingly, the UNGPs have played a major role in institutionalizing norms around business impacts on human rights in transnational business governance.

## Understanding the Governance Structures that Underpin Responsible Investment Decision-Making

Heather Hachigian

Carleton Centre for Community Innovation,  
Ottawa, ON, Canada

## Synonyms

Ambiguity; Decision-making; Governance; Uncertainty

## Introduction

The aim of this chapter is to consider the extent to which best practice governance can be adapted to support effective responsible investment (RI) decision-making. Governance refers to the mechanisms and processes by which decision-making is managed. Best practice governance emphasizes institutional coherence, expertise, and effective processes of deliberation (Clark and Urwin 2008). This chapter focuses on institutional investors with long-term investments horizons, such as pension funds, endowments, and sovereign wealth funds. As universal owners, it is widely held that these investors must incorporate relevant environmental and social issues into their investment decision-making to achieve their investment objectives.<sup>1</sup>

<sup>1</sup> Universal owners hold diversified and long-term portfolios that are representative of global capital markets. Therefore, universal owners cannot ignore the externalities associated with individual investments.

This chapter argues that adding environmental and social dimensions to the already complex process of investment decision-making requires increasing and ongoing investment in an investor's own governance. The form of governance required depends on the perspective motivating an investor's RI strategy. The literature can be divided broadly into two perspectives. The first perspective suggests that investors should limit their consideration to environmental, social and governance (ESG) issues that are underpinned by a sound business case in the form of a financial risk or opportunity. A second perspective suggests that financial risks and opportunities at the portfolio level cannot always be meaningfully separated from broader political, ethical, and sustainability issues. This second perspective requires that investors adopt a more reflexive form of governance to understand how their own decision-making frameworks interact with and contribute to shaping risks and opportunities at the systems level.

### **Business Case Perspective of Investment Decision-Making**

The business case perspective, which historically has dominated the RI literature, suggests that trustees have a fiduciary obligation to take into account material ESG information in their investment decisions. Materiality refers to a substantial likelihood that disclosure would impact an investor's decision. The concept relies on traditional corporate valuation parameters for determining financial impact.<sup>2</sup> There is an emerging consensus among academics that, at least over the long-term, companies with strong material ESG performance demonstrate enhanced operational performance and are considered to be less risky. The business

case has been widely influential in institutional investors' adoption of RI policies.

### **Governance Challenge for the Business Case**

The governance challenge facing institutional investors seeking to implement an RI strategy, like the challenge facing any investor, is making decisions and managing risk in the context of complex and rapidly changing global financial markets. Asset owners often delegate significant responsibilities for investment decisions to the asset management industry, which, in turn, delegates responsibility for selecting and implementing productive projects to corporate managers. The governance challenge is often framed in principal-agent terms, where ESG information asymmetries inhibit market efficiency.

### **Best Practice Governance for the Business Case**

From the business case perspective, it is assumed that implementing an RI strategy requires only limited change to an asset owner's existing governance processes. For example, Woods and Urwin (2012) adapt Clark and Urwin's (2008) best practice governance to inform a practical framework for pension funds seeking to implement an RI strategy. Their framework allows investors to integrate material ESG issues, while noting that nonfinancial (e.g., ethical) concerns should only be addressed by investors that are not bound by fiduciary duty. Moreover, it is widely held that trustees should delegate authority for investment decision-making to independent experts to ensure depoliticized decision-making.

Among the changes to governance that are required for an RI strategy, Woods and Urwin recommend that trustees identify the resources necessary for the investment strategy, promote strong leadership to manage conflicting views, implement a risk budget framework to capture quantifiable ESG risks, and ensure asset managers have appropriate skills to integrate ESG issues. Their framework pays close attention to two dimensions of governance: clarity of mandate and investment beliefs.

*Clarity of mandate:* When implementing an RI strategy, investors should adopt an RI mission

<sup>2</sup> As a legal concept, the US Supreme Court defines information as material if there is a "substantial likelihood that the disclosure of the omitted fact would have been viewed by the reasonable investor as having significantly altered the 'total mix' of information made available." This definition informs the Sustainable Accounting Standards Board (SASB) reporting framework.

statement that aligns with their other mission statements. Moreover, the commitment of all agents in the asset management chain to the RI mandate is considered essential. Securing this commitment requires asset owners to assess the ESG skills of managers, integrate ESG reporting expectations into mandates, and ensure that the management and selection of ESG issues are integrated into performance reviews.

*Investment beliefs:* Securing this commitment also requires asset owners to ensure that investment mandates align their managers' investment approach with their own investment beliefs. Explicitly stated investment beliefs that are evaluated against future scenarios are essential to an effective RI strategy. While Woods and Urwin note that uncertainty and ambiguity are problematic for forming investment beliefs related to some ESG issues, they distinguish between the subjective investment beliefs of naive investors and the investment beliefs of experts. Implicit in this argument is that experts can reduce uncertainty and ambiguity to risk by using the machinery of probability. The authors predict that at some point the goals of RI will become internalized into institutional investors' belief systems, as fiduciary duty standards evolve to reflect new norms underpinning investment.

### **Integrated Perspective of Investment Decision-Making**

There are, however, reasons why fiduciary duty may not evolve in the way suggested above. As a standard for investment behavior, scholars often point out that fiduciary duty looks to convention rather than innovation. This does not mean that the legal concept is itself static. Interpretations of fiduciary duty evolve to reflect interests of those with power to shape its interpretation. As such, Clark et al. (2015) suggest that government has a role to play in clarifying fiduciary duty in ways that protect the interests of vulnerable groups, such as future generations. Some scholars go so far as to argue that the business case has reached its limits, citing examples of where the business case fails to provide for meaningful action on ESG

issues that manifest at the systems level and that interact with and shape portfolio-level risks.<sup>3</sup>

This second, integrated, perspective implies that investment strategies that focus solely on portfolio-level risks and opportunities are insufficient to achieve long-term financial return objectives. Some scholars have placed emphasis on the ethical dimensions for ESG investing, noting that ethical motivations can encourage investor action when the business case fails. Other scholars emphasize the long term and draw attention to the importance of considering broader sustainability issues for which materiality is indeterminate or ambiguous at the portfolio level. For example, a long-term perspective requires pension funds to pay attention to consequences of issues like climate change over several decades to fulfill their responsibility to balance the interests of current generations with those of future generations.

### **Governance Challenge for the Integrated Investment Perspective**

While different philosophical approaches underpin this second perspective, these approaches share an appreciation for the ambiguity inherent in modern investment decision-making. Ambiguity is a problem of interpretation, rather than a problem of information. Problems of interpretation arise because complexity and interdependence obscures efforts to measure risks using conventional finance tools that rely on probabilistic reasoning. In other words, decision-makers do not have sufficient information about the structure of the problem they are trying to solve.<sup>4</sup> Therefore, the Bayesian decision-making model that explains how decision-makers transform

<sup>3</sup>The Investment Integration Project encourages investors to consider how systemic-level issues interact with and shape risks and opportunities at the portfolio level. For an overview of the framework, see Lydenberg, S. (2015). Portfolios and Systemic Framework Integration: Towards a Theory and Practice. Exposure Draft, November 2015 and Lydenburg's "New Models of Finance" in this volume.

<sup>4</sup>For example, "Calibrating the geographical impact of climate change thereby discriminating between regions of the earth on the basis of likely environmental conditions over the next 20, 50 to 100 years remains a significant challenge" (Clark et al. 2015, 604).

uncertainty and ambiguity into risk by learning and updating their beliefs overestimates what agents can learn under changing and complex environments.<sup>5</sup>

To make this discussion more concrete, consider the example of climate change. Adopting a business case perspective allows investors to focus on specific aspects of climate change risk at the individual company and the portfolio level. Investors can make decisions based on their beliefs about the probability of climate change policies eliminating oil and coal reserves from corporate balance sheets or increasing the risk associated with the portfolio's carbon intensity. Moreover, investors can find solace in the certainty of their decisions and can justify their decisions to others. But in doing so, decision-makers necessarily ignore complex interactions that cannot be quantified and understood in probabilistic terms.

For example, carbon footprinting is intended to help investors to shift their portfolios into investments with lower carbon intensities and to reduce climate change risks to their portfolio. While these metrics can provide investors with information to determine which investments to shift away from, critics note that the analysis often omits consideration for a company's future strategies. A company that is a heavy user of fossil fuel but that intends to launch a new energy project or technology that could have system-wide impacts on the reduction of carbon emissions may not have access to capital to implement the project.

To address these limitations, investors and their agents must be allowed to use their discretion. For example, the *Montreal Carbon Pledge* includes consideration for a corporation's future climate change strategy alongside its emissions and a recommendation that investors or their agents undertake further qualitative analysis.<sup>6</sup> This discretion allows room for evaluating investments at both the portfolio and the systems levels. But discretion also introduces new governance

challenges. Subjective evaluations that rely on human judgments and interpretations can introduce behavioral biases, strategic interpretation, and political interests into investment decision-making; those pathologies that the financial industry has sought to eradicate.

An example of how these pathologies can manifest is the strategic interpretation of corporate sustainability ratings. The Center for Political Accountability (CPA) rankings of political spending disclosure practices of S&P 500 companies are intended to provide investors with information to make better decisions and to ensure that political spending benefits the company rather than the personal interests of corporate managers. In a brief advising of corporate managers on how to respond to shareholder proposals on political spending, a law firm promotes its services to "help companies be perceived by these group as good corporate citizens. . . without altering current practices."<sup>7</sup>

It is often assumed that opportunities to exploit such market inefficiencies will be resolved over time, as institutions and organizational forms evolve to correct for transaction frictions and behavioral distortions. For example, the Sustainability Accounting Standards Board aims to eliminate ambiguity in corporate sustainability reporting by supplying the market with a comprehensive set of standards. But who holds the standard setters accountable?<sup>8</sup> Moreover, it is possible that market institutions can remain "locked in the past," as standards of performance used to evaluate asset managers and consultants tend to discount innovation in favor of arrangements that are considered legitimate (Clark and Monk 2015).

<sup>5</sup> For an example of decision-making under changing and complex environments, see Epstein and Schneider (2007).

<sup>6</sup> <http://montrealpledge.org/>

<sup>7</sup> Covington & Burling LLP claims that it can "provide clients with the least invasive and least intrusive disclosures they can make and still receive full credit. This lowest denominator approach can help companies increase their scores without adding unnecessarily burdensome compliance and information gathering systems." See page 16, Corporate Governance Advisor, volume 32, Number 2, March/April 2015.

<sup>8</sup> As noted in a letter to SASB dated July 2016 authored by the Investor Environmental Health Network, "the practical reality is that as a market leader, SASB and its standards do not only provide information that investors seek – it effectively plays the role of advising investors as to the type of information that they should seek."

Another way that investors can reduce market inefficiencies is by using relational contracts to promote mutually beneficial behavior by invoking a long-term relationship. Given the risk and uncertainty that characterizes financial markets, relational contracts are common in the investment management industry. There is an implicit assumption in the relational contracting literature that the parties share an understanding of the promise underlying the relational contract. But what if they do not share the same understanding? An ambiguous understanding of the promise underlying the relational contract provides room for interpretation of contracts in ways that can be more beneficial to one party than to the other. This clarity problem draws attention to the possibility that reasonable people can hold different understandings of a relational contract, even over the long-term (Gibbons and Henderson 2013).

Consider the potential for different understandings between asset managers and asset owners. Asset managers and consultants are often in a privileged position relative to their clients due to network effects and informational advantages. That is, by virtue of repeated transactions and interactions, intermediaries often have access to better information and better relationships than their clients. This positioning allows intermediaries to interpret institutional arrangements (e.g., contracts) in ways that align with their own interests, often at the expense of their clients' long-term interests. Contrary to best practice governance, clarity of an RI mandate across the asset management chain is not always possible.

As these examples demonstrate, the ability to see and to act in shades of gray is increasingly important in complex and interdependent financial markets. But so is the ability to justify decisions in black and white. The tension between these two imperatives lies at the heart of the governance challenge for the integrated investment perspective.

### **Best Practice Governance for the Integrated Investment Perspective**

The integrated investment perspective requires a deeper commitment to the governance of decision-making than the business case

perspective. In particular, the integrated investment perspective requires adapting decision-making frameworks to contexts where uncertainty and ambiguity cannot be reduced to risk by using subjective probabilities or eliminated with standards and relational contracts.

One response to the governance challenges facing asset owners in complex environments has been to bring investment management in-house to ensure closer control over decisions. A key dimension of success with this strategy is the ability to offer competitive pay in order to attract talent. For many smaller funds that lack resources and capabilities, bringing investment management in-house is not a viable option. Moreover, despite their challenges, intermediaries also provide significant benefits. For example, Clark and Monk (2015) find that investment consultants complement investors' resources and capabilities and are essential to innovation and success in complex decision-making environments.

Recognizing the value of intermediation in complex investment environments, governance of RI decision-making from the integrated perspective requires asset owners to manage and to negotiate competing interpretations of complex and evolving sets of information with the asset management industry. Key to success is reflexivity. As a governing principle, reflexivity requires institutional investors to understand how their own decision-making frameworks interact with and contribute to shaping systemic-level risks and opportunities and to learn from their mistakes (Clark et al. 2015).

In practical terms, investors can exercise reflexivity in reviewing the investment beliefs and strategies of their managers and assessing ESG skills and performance of their managers. For example, reflexivity allows asset owners to see the inherent contradiction between short-term performance metrics often used to evaluate their managers and the long-term ESG investment mandates that are awarded to these same managers. Similarly, reflexivity allows asset owners to recognize that it is insufficient to award an ESG mandate to managers without also dedicating resources to ongoing monitoring and dialogue with managers to ensure a shared understanding

of the mandate against evolving and complex investment contexts.

## Conclusion

This chapter has argued that the form of governance required for effective decision-making depends on the perspective that is motivating the investor's RI mandate. Investment decision-making that is motivated by the business case can be managed by adapting traditional governance frameworks that emphasize de-politicized decision-making and clarity of mandate. But those investors that view their investment decisions as interdependent with broader financial, environmental, and societal systems will need to make greater investments in their governance to manage investment decision-making in a complex environment. This is because market efficiency is inhibited, not only by problems of information but also by problems of interpretation. This chapter has focused on the potential lack of clarity of the RI mandate across the asset management chain and the importance of reflexivity in governance. More research is needed to understand how other aspects of governance, such as leadership, incentive design, and systems of deliberation, can cope with the ambiguity inherent in complex decision environments.

United Nations' approach to environmental planetary health and pollution

## Introduction

Recognizing the impact of human activities on the environment, for the past five decades world leaders have convened at global summits to make collective decisions about how to take responsibility and tackle global environmental problems. The first UN Conference on the Human Environment took place in Stockholm, Sweden, in 1972, the result of increasing public and government awareness about environmental problems and the inextricable link between pollution and public and planetary health. One of the most visible and enduring outcomes of the 1972 Stockholm Conference was the creation of the first, and still arguably the premier, global environmental institution: the United Nations Environment Programme (UNEP) headquartered in Nairobi, Kenya.

“Since 1972 UNEP has been the mothership for watching the horizon, identifying both emerging environmental challenges and solutions; and delivering the science for decision making,” noted Inger Andersen, UNEP’s Executive Director. “It has played an important part in moving the environmental needle on a number of critical issues” (Ivanova 2021). UNEP has successfully addressed major global environmental problems, including the reversal of the depletion of the ozone layer, curbing of regional seas pollution, and the launch of international regulation of chemicals and waste. Though UNEP has faced challenges due to limited capacity, connectivity, and credibility, it has increased awareness about the environment and catalyzed the creation of a number of multilateral environmental agreements. This chapter presents an overview of UNEP’s creation, accomplishments, and difficulties since its creation.<sup>1</sup>

## Anchor Institution for the Global Environment

Designed as a nimble, fast, and flexible entity at the core of the UN system, UNEP was to be the world’s ecological conscience and the center of gravity for environmental affairs, the anchor institution for the global environment. It was to assess the state of the global environment, provide policy guidance, and coordinate the environmental activities across the UN system. UN General Assembly Resolution 2997 of December 15, 1972 on *Institutional and Financial Arrangements for International Environmental Cooperation* created the United Nations Environment Programme with a Governing Council comprising 58 member states representing the five UN regions for 3-year terms, a small secretariat headed by an Executive Director, a voluntary Environment Fund to provide financing to enable the new institution to fulfill its policy role, and an Environment Coordination

Board to ensure efficient coordination of environmental activities in the UN system (UNGA Resolution 2997).

Coordination of the environmental activities in the UN system was UNEP’s *raison d’être* and the institution was created as an explicitly normative body that offered a framework for member states to exchange information and views, develop and legitimize policies, and negotiate binding legal agreements. When creating international entities within the UN system, states have three main choices: a specialized agency, a subsidiary organ within the UN General Assembly and the Economic and Social Council, or an office within the UN Secretariat.

Specialized agencies are autonomous organizations set up independently and linked to the UN through special agreements in accordance with Articles 57 and 63 of the UN Charter. They are created through the adoption and ratification of intergovernmental treaties, and the UN General Assembly has no direct administrative, programmatic, or financial authority over them. Specialized agencies need no approval from the UN General Assembly or any other UN authority to make or implement decisions that fall within their mandate. Examples include the International Labour Organization and the World Health Organization. Subsidiary organs are entities created under Article 22 of the UN Charter to address emerging problems and issues in international economic, social, and humanitarian fields. They can have many different formal designations – programs, funds, boards, committees, commissions, councils, panels, and working groups – and governance structures. The UN General Assembly exercises oversight over subsidiary organs, which usually have a limited membership designed to be geographically representative and voluntary financing mechanisms. Examples include the UN Development Programme and UNICEF. The third institutional option is an office within the UN Secretariat with discrete responsibilities in an issue area or overarching coordination functions. The Office for Coordination of Humanitarian Affairs (OCHA) is an example.

Governments created UNEP as a subsidiary body, for three main reasons. First, a new

<sup>1</sup> The narrative draws on the author’s recent book *The Untold Story of the World’s Leading Environmental Institution: UNEP at Fifty*, MIT Press 2021.

specialized agency would need to assume functions already performed by existing agencies and create unnecessary duplication. Second, relegating the entire integrative concept of the “environment” to one specialized agency was deemed disadvantageous because the focus on the environment as another “sector” ran the risk of isolating and miring the new agency in jurisdictional difficulties. Third, creating an entity through a UNGA resolution was the simplest and quickest way of creating the new entity as opposed to a lengthy treaty negotiation process.

Over time, UNEP has grown from a small entity in Nairobi to an organization of over 1,200 staff in 45 duty stations in 43 countries around the world (Figs. 1 and 2). It has also continued to be “the leading global environmental authority that sets the global environmental agenda, promotes the coherent implementation of the environmental dimension of sustainable development within the United Nations system, and serves as an authoritative advocate for the global environment” (UNEP 2019). However, torn between a highly normative mandate to measure the state of the environment and to catalyze and coordinate action, and the pull to respond and act on concrete demands for immediate support, UNEP has struggled to find its place and its voice and to define its institutional identity. Seeking to find its place among the existing UN agencies – larger in terms of staff, resources, and infrastructure – UNEP has moved toward a more operational role. Concrete projects are noticeable, easy to showcase and report on, and promise direct return on investment, a compelling response in the competitive climate for financing and political attention.

As an explicitly normative institution, UNEP was designed to measure, envision, and craft a program, and let others carry it out. Many scholars and policymakers have assumed that UNEP had an intentionally deficient institutional design and argue that if institutional design were to change, any deficiencies would disappear (Biermann 2007). The almost exclusive focus on UNEP’s status as a subsidiary body as the root problem has led to repeated arguments in favor of a fundamental institutional redesign that would

“upgrade” UNEP to a specialized agency. However, a careful analysis of UNEP’s achievements and challenges shows that the vision for “upgrading” institutional design is based on faulty assumptions and needs to be recalibrated. Importantly, changing institutional form does not automatically improve performance. The transformation of the UN Industrial Development Organization (UNIDO) from a subsidiary body to a specialized agency in the 1970s, for example, has not produced evidence of a considerably stronger organization.

## UNEP’s Performance

UNEP has delivered several aspects of its ambitious mandate. It has increased the prominence of global environmental concerns, has led the resolution of a major global environmental problem – ozone layer depletion – and remains highly relevant as recognition of the critical value of the environment increases. It has, however, not been as successful in setting priorities, planning properly, making decisions, and efficiently using its resources. Resolution of problems and launch of important processes happened when UNEP had the means to provide scientific evidence, the authority and political support to convene policy deliberations, and the courage and capacity to create and guide the necessary institutions to support implementation.

Among the most significant successes are the reversal of the depletion of the ozone layer, addressing regional seas pollution, and regulation of chemicals and waste. UNEP also has been critical to the launch of the regulatory regimes on climate change, land degradation, and the loss of species and forests. Importantly, the major success in global environmental governance at large – the reversal of the depletion of the ozone layer – is one of UNEP’s landmark successes and created “a model for effective multilateral action” for tackling major global problems (Benedick 1991). Another important UNEP achievement is the initiative to convene governments in Mediterranean coastal states to develop an action plan for the protection of the marine

**United Nations Environment Programme, Fig. 1** The people of UNEP. (Data Source: UNEP, “Human Resources Management Report,” December 31, 2019. Figure appears in Ivanova [2021](#))

environment and ensure a balance between scientific investigation and legal commitment. The Mediterranean Sea Programme facilitated the creation of a regional network of over 80 laboratories and research institutions from 15 coastal states to share data for baseline studies, pollution source determination, and research. Through consistent efforts on science, policy, and politics, UNEP

enabled states to collaborate to an unprecedented degree to reverse ozone depletion and to limit pollution of shared seas.

Success has eluded UNEP when it competed with other institutions and failed to renew its commitment, sustain its engagement, and provide continuity to projects, programs, and initiatives. Often, governments set up new bodies for the

United Nations Environment Programme, Fig. 2 UNEP offices around the world. (Figure appears in Ivanova 2021)

**United Nations Environment Programme, Table 1** Main sources of financing for UNEP

| Categories                | Description and Source                                                                                                                                                                                               | Focus                                                         |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| UN regular budget         | Constitutes the share allocated from the UN regular budget to UNEP                                                                                                                                                   | Supports mainly the work of UNEP's governing bodies           |
| Environment Fund          | Constitutes non-earmarked contributions from member states                                                                                                                                                           | Supports implementation of UNEP's Programme of Work           |
| Earmarked contributions   | Constitutes trust funds and other earmarked contributions from member states, the Global Environment Facility (GEF), the Green Climate Fund, the European Commission, foundations, the private sector, and UN bodies | Supports selective implementation of UNEP's Programme of Work |
| Conventions and protocols | Constitutes trust funds for fifteen MEAs for which UNEP provides secretariat functions                                                                                                                               | Supports the implementation of MEAs administered by UNEP      |
| Multilateral Fund         | Constitutes assessed contributions from 49 member states                                                                                                                                                             | Supports the implementation of the Montreal Protocol          |

problems UNEP had identified and, as these bodies gained operational independence, UNEP's influence diminished, rendering coordination and collaboration more challenging and costly. Importantly, many of UNEP's challenges are due to limited capacity, connectivity, and credibility.

## Financial Mechanisms

Finances shape performance, but finances are also dependent on performance. Money flows in to support ideas that donors and recipients support, but the ability to deliver on these ideas also affects donations. Careful financial analysis of UNEP's total income over the past 50 years reveals that it is not so much the level of funding as its unpredictability that has been the problem in every decade and under every executive director. The harsh reality of scarce, inconsistent, fragile finances was the result of a political minefield that UNEP had to navigate; under these circumstances, priorities shifted, messages changed, agendas within the United Nations competed, and UNEP was hard-pressed to find its identity and place within the system.

UNEP's financial resources comprise voluntary contributions from member states. They include regular UN budget allocations, member-state contributions to the Environment Fund, and earmarked contributions. In addition, UNEP's revenues include contributions to fifteen multilateral environmental agreements (MEAs) hosted by

UNEP. Assessed contributions to UNEP comprise UN regular budget allocations and assessed contributions to the MEAs and the Multilateral Fund, whereas other funding elements are based solely on voluntary contributions (see Table 1).

In nominal terms, the Environment Fund has more than doubled in 40 years – from \$31.5 million in 1979 to \$70 million in 2019. When adjusted for inflation, however, it decreased by close to 40% – from almost \$111 million to \$70 million. And although UNEP's overall income has grown to \$570 million in 2018, the bulk of it, 87%, came from extrabudgetary, earmarked resources that respond primarily to donor preferences and limit the organization's initiative.

## Leadership and Location

Leadership influences the vision, management, and culture of the organization, its sense of identity and purpose, and is critical to capacity and credibility. The highest leadership post at UNEP is the Executive Director. In the first 20 years, from 1972 to 1993, only two executive directors led UNEP, Maurice Strong, from 1972 to 1975 and Mostafa Tolba, from 1976 to 1993. Subsequently, five executive directors served in office as Table 2 illustrates.

Every executive director has left their indelible mark on the institution. Seeking to reshape the organization's identity, each articulated a new narrative about UNEP's institutional priorities.

**United Nations Environment Programme, Table 2** UNEP Executive Directors

| Executive director   | Term in office |
|----------------------|----------------|
| Maurice Strong       | 1972–1975      |
| Mostafa Tolba        | 1975–1992      |
| Elizabeth Dowdeswell | 1993–1998      |
| Klaus Töpfer         | 1998–2006      |
| Achim Steiner        | 2006–2016      |
| Erik Solheim         | 2016–2018      |
| Inger Andersen       | 2019–present   |

Operating in complex social-relational systems, each executive director has had to balance the demands to serve as technical expert, manager, politician, and visionary. Each had a distinct leadership style and skills and the external and internal pressures within which they operated, shaped the direction in which they took the organization. They had to promote the organization externally to ensure its financing stream and provide direction and vision internally to shape culture and values, the basis for organizational identity. And building on the foundation of their predecessors, each has left a lasting imprint on the organization.

UNEP evolved from an idea about a catalytic entity that would inspire environmental action across a multitude of actors to an independent body that has claimed a place at the UN table. As an anchor institution, UNEP has been shaped by its location in Nairobi, Kenya. It has been anchored in the local community, which has provided much of the labor force, and has influenced the working environment, and the quality of life along with infrastructure and telecommunication. They also anchor the local economy because they are a major employer and customer of goods and services. Much like universities, international organizations have created their own enclaves or campuses that operate as cities within a city, with their own planning, transportation, public safety, health care, and even education.

Contiguous, physically and operationally, with the city of Nairobi, UNEP has been shaped by its location through influencing whom it can recruit and retain, how connected it is to its constituencies, and how accessible it is to existing and emerging partners. The physical distance from

the rest of the UN system and challenging communications in the early decades made UNEP's normative mandate, and its coordination task, daunting. With its headquarters located far outside the dense “hotspots” of political activity, UNEP has been isolated from the UN agencies it was expected to work with closely. Even UNEP's headquarters in Nairobi, has been divorced from the rest of the organization, which is spread around the world with only a handful of staff in each office. UNEP's offices in Paris, New York, and Geneva have tried to step into the liaison role but have been limited by the lack of headquarters status, the reluctance of headquarters to delegate necessary and appropriate responsibility, and scarce human and financial resources. UNEP's isolation from the political pressures of the UN system has, on the other hand, enabled it to carve out its own identity and retain staff for longer periods.

As the first UN institution headquartered in the Global South, UNEP has been at the forefront of environmental challenges and witnessed the tensions among a growing population, development demands, pressure on dwindling resources, degradation of ecosystems, and threats to human security. Staff have seen the urgent demand for technical assistance and felt the need to be more responsive to the needs of recipient countries. Donor governments, however, have continued to send contradictory signals by demanding concrete results rather than broad policy guidance thus pushing UNEP to engage on the ground while also insisting that it remain exclusively normative.

## UNEP'S Potential

UNEP's performance cannot be characterized simply as success or failure. Its track record is complex and nuanced and has evolved over time. Throughout its 50-year history, UNEP has achieved success and has also stumbled. Importantly, UNEP remains the only international institution with the explicit mandate to see the 3,000 piece puzzle from 30,000 feet up and with the ability to put the various pieces together. Its performance, however, has been limited by capacity

constraints, the remoteness from the institutions that UNEP had to influence and coordinate, connectivity challenges in Nairobi, and the uneven credibility of the institution.

In essence, UNEP's performance is characterized by a dichotomy: The organization remains highly relevant, its evolving mandate is ambitious and necessary, and it has increased the prominence of global environmental concerns. It has, however, faced difficulties in setting priorities, creating a clear identity, and efficiently using its resources.

As environmental concerns become more pressing and urgent, it will be critical for UNEP to strengthen its standing as the global environmental authority starting with an inspirational internal vision, capable management, and a clear, confident voice. UNEP's fiftieth anniversary in 2022 provides a symbolic opportunity for fundamental transformation into the authority on the global environment. This commemoration moment has the potential to spur the necessary momentum and political will to launch a transformation through integrated solutions. UNEP could and should become the go-to institution for information on the state of the planet, for a normative vision of global environmental governance, and for support for domestic environmental agendas and non-state actors. It is also time, however, to embrace the two arcs of UNEP's mission – the normative and the operational – in an integrated manner.

## Universities and Corporate Social Responsibility

Deborah C. Poff

Leading with Integrity, Ottawa, ON, Canada

Brandon University, Ottawa, ON, Canada

## Synonyms

Universities and corporate governance; Universities and social responsibility

## Introduction

The university is an inconsistent institution. It is not one community but several (Kerr 2001).

While that was no doubt true in 1963, the university today is ever so much more so and more multifunctional today than it was then. The question which will be examined in this chapter is whether the university is sufficiently corporatized to be considered a good candidate for accountability under the terms of corporate social responsibility. This is a controversial topic with two divided sides – nominally discussed under the heading of the purpose of a university. Both sides of this controversy will be discussed here.

While the history of universities is very old and varied, dating back to medieval times, this chapter will focus on the university of the twentieth century.

## The Purpose of the Twentieth-Century University

Particularly in democratic nation states, universities had their largest contemporary transformation as institutions after World War II. As Poff notes (2022),

Rhetoric at the time was idealistic and expansive with respect to the benefits of higher education and the future of the state and its citizens. University education would serve as a vehicle for the social and economic mobility of veterans and their children. . . .

In Canada, as in other countries, the promotion of this idealism and aspirational commitment to higher education included the introduction of various forms of subventions through affordable tuition, grant, and loan programs as well as extensive “new build” of a number of new universities. Goals for university education typically identified the following:

- A larger educated population to increase the informed participation in democratic and civic development
- A more highly educated and consequently more prosperous population of World War II

veterans who would reintegrate and flourish in their respective nations

- A larger percentage of educated and skilled professionals to diversify the number and type of job classifications and to advance new science and technology
- A broader population base of educated professionals to increase competitiveness and the GDP in many nations
- Individual social and economic benefits to those achieving higher education
- Better quality of life and health for a better educated population

This idealism also resonated with older traditions of identifying higher education with higher order service to the state and the public and so was well-received and to a large extent accepted as the purpose of a university. Such ideals and beliefs are still part of the vision of what universities should do particularly among university faculty and certainly some parents of university-attending students.

This version of the purpose of a university flourished until two challenges arose in recent history. The first was student activism in the 1960s and 1970s, consistent with increased political militancy more generally in democratic societies. These criticisms essentially attacked universities as not meeting their avowed purpose and in failing to educate students in anticipation of their full purpose as engaged citizens in their nations and in the globe. While this did rattle some governments and parents in terms of the legitimacy of the current state of universities, it had rather minor impact when compared to the global neo-liberal movement beginning in the 1970s with Reagan and Thatcher.

This second movement coincided with privatization and the increased globalization of the economy around the world. The value system which resulted in many privatizations of previously publicly owned services had a sympathetic influence and impact on the value of education for the individual and for the society. Some factors Poff (2022) included,

...The globalization of universities offering access to higher education and research and competing between and among nation states for students and reputation.

...[and] the shift in emphasis to thinking of universities as institutions of higher education for the teaching of future professionals...to characterizing universities as corporate entities existing within a highly competitive national and international environment vying to attract consumers (i.e., students) as well as competing for prestigious grants...

The shifts in ideology...to more conservative “neoliberal” views results in a shifting perspective on the purpose of university education...to private interest [s] with the implication that personal, private funds should pay for the cost of education and the viability of institutions...

The consequent reduction of public dollars for university base operating budgets which has led to increased tuition, more corporate philanthropy... and increased activity in securing alternative funding, including industry-university partnerships and the entry of universities into various commercial ventures.

Traditionally universities have had some commercial ventures. However, such ventures were typically directly related to student needs (e.g., residences, food services, book stores). In the new era of competition, universities have included restaurants, hotels, convention centers, recreation facilities, malls, industrial parks, incubator services for industry, etc.

The issue that emerges in this context is: Is it reasonable to allow universities to operate so many commercial functions while still considering themselves legally and corporately to be non-profit institutions with the primary function of education and research?

Some universities do not think so. The University College of London has accepted its multifaceted, multifunctional activities as requiring a set of principles governing its corporate social responsibility.

The key dispute here appears to be between those who contend that to call universities corporate entities and argue for treating universities as such entities which require the imposition of corporate accountabilities is to further bolster the marginalization of the true purpose of universities which is to teach and create new knowledge. The

other side of the argument is that to allow universities to participate in so many commercial ventures while operating under nonprofit institutional status is to create public institutions which are remiss in their private responsibilities and accountabilities.

Some argue that these are merely political contingencies and that a shift in politics can return universities to their original purpose and status. Others argue that independent of any particular ideological shift, the university of the twenty-first century will necessarily have positive and purposive reasons to operate within an industry-university context. This is the nature of applied scientific and industrial discovery and the future of universities whatever the political context.

## Introduction

In Western economies, the charging of interest on loans is something that is rarely questioned. It is deemed necessary, in order to generate income and to offset the risk that loans might not be repaid (Benfield 1968). Modern Western legal prohibitions against usury, such as they are, center on the notion of preventing financial service organizations from charging *excessive* interest (Lewison 1999), which is certainly how modern dictionaries define it (Oxford Living Dictionaries 2017). However, this was, and is, not always the case.

For millennia, the charging of any interest on loans at all was considered ethically wrong in many cultures and religions (El-Gamal 2006; Meislin and Cohen 1964). In both premedieval Europe and the Middle East, the charging of interest on loans was prohibited by religious authorities (Mews and Abraham 2007). However, during the Renaissance and Reformation, the twin influences of Protestantism and commercialization shifted the understanding of, and proscription against, charging interest to that of charging excessive interest for loans (Lewison 1999). However, Islamic finance organizations do not charge interest on loans to this day.

Thus, over time, various legal, economic, and religious perspectives have resulted in two rather distinct understandings of usury, even though the same word is commonly used to describe both. These two understandings are differentiated in this entry by using usury<sup>i</sup> to refer to the prohibition of charging of any *interest* on loans, while usury<sup>ei</sup> refers to the prohibition of charging of *excessive interest* on loans. Usury<sup>i</sup> will be considered first, as it has the longest history.

## Usury<sup>i</sup>: As the Prohibition Against Charging of Interest for Loans

There is more than one reason why usury<sup>i</sup> was proscribed. While exploitation of the poor and needy is a recurrent refrain, other reasons include that the income has not been earned through actual work (unearned income), which seemed to have originated with Aristotle (Meislin and Cohen

1964), although this was also noted later by theologians due to their understanding of the nature and virtue of manual work (Visser and Macintosh 1998). Other objections are that interest on a loan means that the debtor effectively pays for an item more than once (double billing) (Sauer 2002; Visser and Macintosh 1998). The vast majority of authors, though, understand that the main reason that usury<sup>i</sup> is considered as being unethical is that it adds to the burden of the poor, and it is unconscionable that the rich should profit due to the suffering of the poor (Chewning 1995).

The earliest references to usury<sup>i</sup> appear to be Babylonian (Blitz and Long 1965), although other authors noted detailed codification in Indian religious texts and similar developments in the Torah or Pentateuch (first five books of the Old Testament) (Visser and Macintosh 1998). From a philosophical perspective, Aristotle, Plato, and Seneca were among the ancient philosophers who argued against charging any interest on loans (Visser and Macintosh 1998). Thus, for thousands of years, philosophers and religious leaders from many cultures have concurrently argued against charging of interest on loans.

The proscription of usury<sup>i</sup> in the Torah or Pentateuch is important as it informs three great monotheistic religions, Judaism, Christianity, and Islam (Jafri and Margolis 1999), all of which hold these five books as sacred. In Judaism, the charging of interest on loans to the poor or to other Jews is clearly forbidden [Exodus 22:25], although charging of interest in business dealings with foreigners is allowed [Deuteronomy, 23:19–20] (Visser and Macintosh 1998). In Islamic finance, the prohibition of interest on loans – *riba* in Arabic – is still in force [Qur'an Surah al-Baqarah, 2:275] (Sauer 2002; Visser and Macintosh 1998). Thus, from ancient times, many religions have forbidden charging of interest on loans, largely to protect the poor.

Drawing on both the Old Testament (including the Pentateuch) and New Testament scriptures [Luke 6:35], usury was broadly condemned in Europe with the earliest formal church ban in 325 AD (Lewison 1999). This continued for centuries and in medieval times, culminating in its prohibition in both church and secular laws

(Visser and Macintosh 1998), the Catholic church teaching that charging interest resulted in loss of salvation (Reed and Bekar 2003). While Ekelund et al. (1989) argue that this was just a form of rent seeking by the church in order to reduce their own interest rates, this underemphasizes the theological importance of financial justice for the poor and that the benefit of canon law injunctions would likely be felt by all of society, not just the Catholic Church itself (Glaeser and Scheinkman 1998; Reed and Bekar 2003). As will be noted in the next section, Christian thinking shifted significantly during the Reformation period.

Most religions hold that repaying a debt is considered a religious obligation of the debtor (El-Gamal 2006; Tamari 1990). Thus, debt itself is not prohibited, but once in debt, a person needed to repay that debt. In ancient societies, failure to repay a debt typically resulted in imprisonment or slavery for the debtor (Ford 1926) or a flogging (Silberg and Ben Porath 1961). Thus, there was considerable religious and legal coercion to repay debt. Note, the giving, receiving, and repayment of loans were not an issue, while the charging of interest and the nonrepayment of loans were. These are not separate issues, as charging interest makes it more difficult for a debtor to repay the loan. Usury<sup>i</sup> is, therefore, both a religious and an economic issue, to which there were often legal implications.

It is important to note that when religious rules around usury<sup>i</sup> were established, there were no real financial institutions, nor welfare systems in place, or at least none apart from religious organizations themselves. In these contexts Glaeser and Scheinkman (1998) provide an extended economic argument that usury laws were a form of social insurance, while Reed and Bekar (2003) develop this further, noting the role philanthropy has in ensuring the needs of the poor are met. Thus, religious teaching provides two forms of finance that are available to the poor in years of need: alms (philanthropic gifts which do not need to be repaid) from religious institutions and loans (which need to be repaid, albeit without interest) (Reed and Bekar 2003).

Core to the arguments of Glaeser and Scheinkman (1998) and Reed and Bekar (2003)

is the idea that alms and loans act as a form of social insurance to smooth out temporary financial shortages for the poor. In good times when relatively rich, individuals invest in religious institutions through tithes/zakat and offerings (formal pooling of resources) as well as in neighborhood networks through philanthropy and giving loans (informal pooling of resources) (Reed and Bekar 2003). In lean times when relatively poor, these same individuals can make withdrawals from those systems.

Usury<sup>i</sup> disrupts both these economic distribution systems. In terms of charging interest for loans, usury<sup>i</sup> does not equitably and temporarily shift assets in a social system. Instead the charging of interest transfers wealth permanently from the relatively poor to the relatively rich (Glaeser and Scheinkman 1998), as both capital and interest on the loan are paid. The “rich get richer and the poor get poorer,” which is the antithesis of a system designed for neighbors to simply help each other through difficult times. As Visser and Macintosh (1998) note, this is one of the strongest economic arguments against usury<sup>i</sup>, as the overall utility of the economy is reduced.

Reed and Bekar (2003) note that usury<sup>i</sup> also disrupts philanthropy. Lending money at interest, reduces the amount of capital wealthy people have to donate philanthropically. Thus, while their rewards on earth (finances) increase, their rewards in heaven (from almsgiving) decrease (Reed and Bekar 2003), not to mention decreasing the amount available to give to the poor. Thus, usury<sup>i</sup> limits surplus cash available for the relatively rich to give philanthropically. This, in turn, inhibits the ability of organizations to meet the needs of the poor, as they receive reduced donations.

While in many Western countries it is now considered normal to charge interest on loans, it is worth noting that as late as the sixteenth century, it was illegal to charge interest on loans in England (Posner 1995). The discussion above outlines why such bans may be morally and economically justifiable, particularly when there is little or no government-sponsored welfare system. Legal prohibitions against usury thus act to maintain social and religious insurance mechanisms

and ensure the poor have access to finance so as to overcome temporary need.

In many parts of the world, prohibition against usury<sup>i</sup> still exists. While many Western democracies with a Christian heritage have legalized the charging of interest, some authors charge that biblical principles still apply, and in particular that interest should not be charged on loans to the poor (Chewning 1995; Meislin and Cohen 1964). In many Jewish communities, the prohibition against charging interest, particularly to their own community, is often still taken literally with interest-free loans being common. As noted earlier, in Islamic finance, usury<sup>i</sup> is prohibited. However, it should be noted that Islamic finance is a well-developed and comprehensive approach to financial services and should not be reduced to just not charging interest (El-Gamal 2006).

### **Usury<sup>ei</sup>: As the Charging of Excessive Interest for Loans.**

As outlined above, for most of recorded history, religions and societies had prohibited usury<sup>i</sup>, understood as the charging of interest on loans. Over time, however, the understanding of usury shifted in many, although not all, contexts to mean a prohibition against charging *excessive* interest, or what I am terming usury<sup>ei</sup>. Note the core concerns which drove discussion of usury<sup>i</sup> also drive discussions of usury<sup>ei</sup> – how to avoid exploiting the poor (Visser and Macintosh 1998).

As early as 200 AD in India, the focus had shifted to considering when the charging of interest on loans might be above a rate that would be considered socially acceptable (Visser and Macintosh 1998). This undermines the attempt by some authors to lay the shift from usury<sup>i</sup> to usury<sup>ei</sup> squarely at the feet of a single theologian, John Calvin, and while often mentioned, this sole causal connection has been strongly contested (George 1957). While the influence of Calvin is discussed below, it is important to note that there were also social shifts (particularly the declining influence of the Roman Catholic Church on Protestant states), high inflation rates, and the development of market economies hungry for capital

that all contributed to the development of usury<sup>ei</sup> (Glaeser and Scheinkman 1998). Thus, medieval prohibitions on usury<sup>i</sup> gave way, under forces of the Reformation, Renaissance, and the rise of market economies in Europe, to a narrower condemnation of charging excessive interest (usury<sup>ei</sup>) (Visser and Macintosh 1998).

As a thinker, Calvin was highly influential as he deliberately sought to apply theological concepts to issues which would now be considered the realm of economics, governance law, politics, and sociology (Gatgounis and George 1996). Lewison (1999) argues that there were actually two shifts in Western thinking that were articulated by Calvin: the first was to differentiate between charging interest and charging *excessive* interest on loans. This distinction still frames much of current thinking about usury, including this article. The other is to differentiate between commercial loans and personal loans.

Theologically, the shift in Europe occurred initially in relation to differentiating between commercial transactions and personal financial transactions (Chewning 1995). Meislin and Cohen (1964) argue that usury<sup>i</sup>, charging interest on loans, was allowable particularly in relation to trade. Most biblical references to giving and receiving loans focus on transactions between individuals, not between institutions and individuals (Chewning 1995). Even in Jewish and Islamic traditions, different forms of contract have been developed which allow for the advancement of funds and for the generating of a commercial return, while not violating the proscription of usury<sup>i</sup> (Lewison 1999). While these mechanisms have been criticized as a hidden form of interest, the issue is to differentiate between just compensation for labor and usury<sup>i</sup> (Mews and Abraham 2007).

The Hebrew word used in the Old Testament book of Exodus for usury<sup>i</sup> means to bite or gnaw (Conter 1989; George 1957) and is understood as a prohibition on the consumption of future earnings of the debtor (Chewning 1995). For Calvin, this was critical as he understood usury<sup>ei</sup> – the gnawing by the lender of the future income of the debtor – to mean charging excessive interest, rather than interest plain and simple (Graafland 2010; Lewison

1999). Meislin and Cohen (1964) agree, arguing the biblical prohibition was mainly against loans specifically targeted against the poor (usury<sup>i</sup>) or against charging excessive interest to those engaged in trade (usury<sup>ei</sup>). Aside from those two exceptions, charging reasonable amount of interest in business transactions was deemed acceptable (Chewning 1995; Meislin and Cohen 1964).

Graafland (2010), while noting Calvin's prohibition on charging interest to the poor, also notes that Calvin did not provide *carte blanche* approval of commercial interest on loans, but instead provided a number of conditions. Firstly, providing loans at interest should not prohibit philanthropy or providing interest-free loans to the poor (Graafland 2010), thus addressing the concern raised by Reed and Bekar (2003) earlier. Secondly, any interest charged should be such that the lenders would be prepared to pay themselves, which addresses the issue of exorbitant interest. Finally the loan should enable the debtor to make a higher profit, even after repaying the interest, than if the loan had not been given (Graafland 2010). If these conditions were not met, then an interest-free loan should be provided.

Adam Smith and John Keynes both opposed laws which prohibited charging interest on loans (usury<sup>i</sup>) while endorsing laws that prohibited the charging of excessive interest (usury<sup>ei</sup>) (Visser and Macintosh 1998). Adam Smith proposed the legal imposition of a cap on interest rates as the mechanism to do this (Visser and Macintosh 1998). This is not without precedent as the Babylonian King Hammurabi imposed a 10% cap on interest, as did Henry VIII of England (Horack 1941). In 1965, a US federal law put a cap of 7% on national banks, to curb excessive interest (Blitz and Long 1965). While the amount of interest capped varied over time, as does the definition of "excessive interest," modern Western usury<sup>ei</sup> laws are seen to prevent oppression of the poor on grounds of unconscionable conduct (Cavalier 2013; Posner 1995). Glaeser and Scheinkman (1998) note that sometimes legislation has been repealed in order to allow market forces to set maximum interest rates, and Mews and Abraham (2007) note that usury laws were repealed in England by 1854, largely due to the arguments

of Jeremy Bentham against Adam Smith (Hollander 1999).

While many countries have usury<sup>ei</sup> laws in place, organizations which provide financial services outside the traditional banking sector, such as rent-to-own, payday lenders, and pawnbrokers, typically charge interest rates that are often considerably higher than banks (Lewison 1999). For example, the rent-to-own approach results in charges up to 450% higher than a cash sale (Lewison 1999), which is justified largely based on the perception that people with lower incomes have a higher risk of defaulting. Similar concerns have been raised in relation to high interest rates being charged to the poor by microfinance organizations (Sandberg 2012). Such high interest rates surely must raise questions regarding whether we need to reexamine the need for usury<sup>ei</sup> laws to prevent exploitation of the poor.

From an economic perspective, charging higher interest rates can be justified on the basis of risk – where ventures which are riskier can be financed and the risk offset by charging higher rates of interest. This is one of the criticisms of the capped approach to interest rates as this may preclude some business people, with riskier ventures, from gaining access to loans (Benfield 1968). However, this still points to a differentiation between personal lending and commercial lending, as argued by Calvin.

## Conclusion

While discussion of usury<sup>i</sup> is often considered archaic, some prohibitions were still in place across Europe relatively recently (Horack 1941) and are still in force across many Islamic countries (El-Gamal 2006). After medieval times, in Europe, the prohibition in both economic and theological thought shifted away from usury<sup>i</sup> to notions of unconscionably high interest rates (usury<sup>ei</sup>). Today, in Europe and nations which draw on a European legal heritage, such as Australia and the USA, it is usury<sup>ei</sup> which still exercises the concern of economists, lawyers, politicians, and theologians alike.

However, the growing prominence and viability of Jewish and Islamic financial systems have led many authors to re-question some of the core concerns of usury<sup>i</sup> (Helfand 2011; Mews and Abraham 2007; Reed and Bekar 2003; Sauer 2002). Mansfield (2000) argued that the winding back of usury<sup>ei</sup> laws contributed to subprime home equity market issues as early as 2000 (Mansfield 2000). Likewise, the global financial crisis (GFC) of 2008 caused some authors to revisit the core concerns of usury<sup>i</sup>. Some extensively considered whether the specific stipulations of Calvin (Graafland 2010) or even the prohibitions and mechanisms of Islamic finance (Cavalier 2013) might have curbed some of the worse elements of the GFC.

## Utilitarianism

Deborah C. Poff

Leading with Integrity, Ottawa, ON, Canada

Brandon University, Ottawa, ON, Canada

### Synonyms

Average utility maximization; Consequentialism; Maximizing good

### Definition

Sometimes defined as the greatest good for the greatest number where everyone is to count as one and no one as more than one. The purpose here is to maximize average utility or good outcomes. An ethical theory that argues that what is morally good is related to the consequences of following actions or rules whose purpose is to minimize harm while maximizing good outcomes to persons or other sentient beings. Good is variously defined as pleasure while harm is defined as pain. This definition was the initial definition by Bentham. Mill later articulated various higher and lower (by quality and quantity) types of good or types of happiness.

### Introduction

Utilitarianism is one of the strongest and most popular ethical theories in contemporary moral thought (the other main contenders being Deontology and Virtue Ethics). Utilitarianism is most closely identified with Jeremy Bentham and John Stewart Mill, although there were other advocates both in the nineteenth century (notably Sidgwick) and numerous advocates in contemporary times. Mill (1806–1873) was the intellectual heir to the philosophy of Jeremy Bentham (1748–1832). Bentham was a friend and patron of Mill's father, James Mill. He was jointly raised under the highly eccentric pedagogical approach of his father and with considerable influence from Bentham. Mill

spent his early adult years collecting and editing Bentham's writings which were previously unpublished. Mill's work consequently resulted in the introduction of Benthamite Utilitarianism to the world.

Utilitarianism was so named because of the assumption that there is more utility in a moral calculus where behavior and choices which maximize happiness are considered morally good and where actions and rules that do the opposite are considered morally bad. This theory is also referred to as a consequentialist theory because appropriate moral actions and choices are evaluated as such by virtue of the consequences or outcomes of those actions and choices. Utilitarian theory differs radically from theories which claim that actions and choices are intrinsically or universally and categorically morally correct independent of any consequences of following certainly moral maxims or precepts. Among other criticisms, this has led to the charge that utilitarianism is relativist, pragmatic, and instrumental in nature.

Mill also called Utilitarianism a theory which was based on the Greatest Happiness Principle. This principle, according to Mill, "holds that actions are right in proportion as they tend to promote happiness, wrong as they tend to produce the reverse." Further he explained,

According to the Greatest Happiness Principle. . .the ultimate end, with reference to and for the sake of which all other things are desirable (whether we are considering our own good or that of other people), is an existence as far as possible from pain, and as rich as possible in enjoyments, both in point of quantity and quality; the test of quality, and the rule for measuring it against quantity, being the preference felt by those who in their opportunities of experience, to which must be added their habits of self-consciousness and self-observation, are best furnished with the means of comparison.

In explaining utilitarianism in this manner, he not only elaborates upon Bentham's understanding of utility as maximization of pleasure and minimization of pain but also addresses critics of utilitarianism who cast it as hedonistic and low in its focus on pleasure and pain. In his book, *Utilitarianism*, Mill spends considerable attention in articulating a hierarchy of happiness or goods to

explain that in a civilized and educated population, persons will generally abjure merely sensual pleasures and instead choose higher order sources of happiness, such as, art, poetry, and informed opinion. Mill also believes that with education comes impartiality. This is not self-denial as everyone, including the self-interested individual choosing happiness, gets to count as one but not as more than one.

## Act Utilitarianism

Act utilitarianism (usually more closely associated with Bentham) evaluates the consequences of acts in terms of the amount of good the act produces. In Bentham's original description of description of utilitarianism, he spoke of maximizing pleasure and minimizing pain. Thus, an act is morally good if it produces more pleasure than pain. Bentham did not distinguish between different types of pain and pleasure but did articulate a number of conditions (e.g., duration and intensity) to quantify the differences among different pleasure and pain experiences.

## Rule Utilitarianism

Rule utilitarianism evaluates the consequences of following rules as a methodology for maximizing good and minimizing harm. To use a contemporary example, many countries have laws which require that all drivers of automobiles wear seat belts. While such a rule eliminates freedom of choice with respect to choosing to wear a seat belt (although one may choose to break the law with all of the consequences which may follow from that), the good outcomes are fewer automobile fatalities and fewer serious accidents. This, in turn, results in fewer costs to the state in countries where health facilities are state subsidized.

## Criticisms

The following are the most common criticisms of utilitarianism.

1. Because the requirement is only to maximize utility, it can be unfair to the minority or lead to a kind of scapegoating of some if it is in the interests of reaching average utility.
2. It is a theory where the means justifies the ends. Similar to the first criticism, utilitarianism argues that it doesn't matter if you treat some individuals as a means to an end if the majority's happiness is maximized.
3. You cannot adequately define what is good for everyone. Some individuals enjoy being unhappy. How do masochists, for example, figure into the calculus?
4. Consequences, particularly the long-term consequences of rule utilitarianism, are difficult to determine and the future is uncertain and indeterminate.
5. It is unrealistic and unreasonable to demand that everyone impartially adopt the greatest good for the greatest number principle. In fact, it is contrary to basic human nature which is essentially selfish.

While utilitarians, including Mill, have extensively responded to these and other criticisms, the arguments continue. Among other reasons, this is due to a fundamental difference among competing ethical theories, particularly theories like deontology which assumes that all persons must be treated as an end in themselves and that ethical principles are universal, categorical, and immutable in their nature.

## Business Ethics

Utilitarianism is frequently called upon in ethical discussions of contemporary business ethic dilemmas. One of the most meaningful contributions to ethical debate has been the discussion of who or what gets to count in discussions about business practices and business ethics. While traditionally, only stockholders or stakeholders were deemed to be relevant actors and beneficiaries of business decisions, significant changes have occurred in the debate such that shareholders are now understood to be fair actors and contributors in decisions which impact more than just narrowly

defined stockholders/stakeholders. This includes, for example, indigenous people whose traditional lifestyle is compromised and threatened by resource extraction industries. It also includes externalities like the environment itself. Such discussions have resulted in a larger discourse than just narrow adjudications about profit maximization.

## Values and Ethics and Federalism

Arjun Tremblay

Département de science politique, Université du Québec à Montréal, Montréal, QC, Canada

### Synonyms

Distribution of powers; Division of powers; Unity in diversity

### Definition

The term federalism derives from the word federal which, in turn, comes from the Latin *foedus*, meaning covenant. Experts most often describe federalism as a theory or philosophy of government; by this they mean that federalism represents a set of practical and ethical guidelines for the design of political institutions. When federalism is applied to the design of political institutions, it generally entails two interlinked outcomes: (1) the constitutional enshrinement of a division of powers between two or more levels of government and (2) the institutional accommodation of national, ethnic, territorial, or regional diversity.

## The Two Traditions of Federalism

There are two long-standing intellectual traditions of federalism, each of which offers different justifications for dividing powers between levels of government. The Swiss tradition of federalism is based on the premise that some states are composed of several *demoi* (or peoples) each with its distinct language, religion, customs, and/or traditions. According to this tradition – which was inspired by the Swiss confederal arrangement that lasted between 1291 and 1847 – the division of powers is thus needed to preserve unity within the state but also protect the diversity of territorially concentrated ethnic, national, linguistic, and/or religious minorities.

The American tradition of federalism is based on the dual premise that a state contains only one *demos* (or people) and that it is human nature to want to impose one's will on another. This tradition of federalism – which is best exemplified by the *Federalist Papers* (1788) of James Madison, Alexander Hamilton, and John Jay – therefore views the division of powers as a means to constrain the *demos* and, in so doing, to preserve individual rights and democratic institutions. According to the American tradition of federalism, the division of powers should multiply the centers of public authority in a democracy; in theory, this should protect and preserve democratic institutions by making it difficult if not

impossible for a tyrant or populist majority to fully consolidate power.

### **Federations and Other Systems of Government: Similarities and Differences**

The institutionalization of federalism leads to the creation of a federation that “involves the linking of individuals, groups, and polities in lasting but limited union” (Elazar 1987, p. 5). A number of democracies, including Canada, the United States, India, Germany, Switzerland, Australia, and Belgium, have chosen to implement and to institutionalize federalism. The constitutions of these federations divide powers between two levels of government: a national/central/federal government, on the one hand, and subnational units of government, on the other. These subnational units of government are called states in the United States, India, and Australia, cantons in Switzerland, provinces in Canada, regions in Belgium, and *Länder* in Germany.

Federations share some similarities with confederations and unitary states but differ from these systems of government in important ways. For example, confederations – such as the long-lasting Swiss confederation (1291–1847) and the short-lived Articles of Confederation (1776–1789) that governed post-revolutionary America – have tended to vest policy making jurisdiction primarily in the hands of the subnational constituent units of government and to endow national governments with largely symbolic powers. By comparison, both levels of government in a federation have autonomous jurisdiction over certain policy areas and share jurisdiction over other policy areas. In the Canadian federation, for instance, the federal government has sole jurisdiction over trade policy, taxation, the postal service, the military, and census taking, while provinces have sole jurisdiction over health and education policy, public lands, and property rights; both the federal government and Canada’s provinces share jurisdiction over agriculture, public works, old-age pensions, and immigration policy.

Unitary states (e.g., France, Japan, Sweden, Israel, and Italy) differ from federations in that

the division of powers here is contingent rather than constitutionally enshrined. This means that the central government in a unitary state has the right to rescind the division of powers and to re-centralize public authority at its discretion. Conversely, neither the national/central/federal government nor the subnational constituent units of government in a federation can unilaterally alter the constitutional division of powers. Instead the dissolution of the covenant requires the consent of and collaborative action of more than one of the state’s constitutive *demoi*.

### **Variants of Federalism: Executive, Collaborative, Symmetrical, and Asymmetrical**

Federalism is sometimes used to describe the operations and functions of a particular federation, and in such cases, it is accompanied by one of the following qualifiers: executive, collaborative, symmetrical, or asymmetrical. Executive federalism is used to describe a situation when the central government is clearly the leader among the many constituent units of the federation. By contrast, collaborative federalism (also called cooperative federalism) refers to a state of affairs where the national/central/federal government and the subnational units of government are true and equitable partners in the decision-making process. Symmetrical federalism is used to describe an institutional variant of a federation where all subnational units of government have the same competencies, legal rights, and policy jurisdiction. By contrast, asymmetrical federalism is used to designate a type of federation where one or more, but not all, of the subnational units of government has/have special competencies, legal rights, and/or exclusive jurisdiction over specific policy areas.

### **Multinational Federalism and Minority Accommodation**

There has been renewed interest in the study of federalism in recent years. This interest has been driven in large part by a critique of the American

tradition of federalism. This critique is based first and foremost on the acknowledgment that many modern democracies are multinational in composition. A multinational democracy (e.g., Canada, the United Kingdom, and Spain) comprises a national majority as well as one or several national minorities (e.g., the Québécois minority in Canada; the Scottish, Welsh, and Northern Irish minorities in the United Kingdom; and the Catalan and Basque minorities in Spain). Public institutions in multinational democracies tend to reflect the culture, language, religions, customs, and/or traditions of the national majority. In turn, many national minorities have made and continue to make demands for the recognition of group-differentiated rights (i.e. demands for linguistic, religious autonomy) that, in a federal setting, would require the design and implementation of an asymmetrical federal arrangement. However, the American tradition of federalism views all constituent units of a federation as equal and therefore advocates a federalism that is “constitutionally symmetrical” (Stepan 1999, p. 21). At a more fundamental level, the American tradition of federalism embraces a territorial logic that fails to recognize the coexistence of different “peoples” within the same state (Seymour and Gagnon 2012, p. 5).

Basing themselves on these and other critiques, a growing number of social scientists and philosophers now advocate the design and implementation of multinational federalism. Although a multinational federation would also constitutionally enshrine a division of powers between different levels of government, it would nonetheless differ from other federations in a significant fashion. More precisely, a multinational federation would formally recognize the distinct status of national minorities, it would include national minorities in foreign policy making, and it would operate under the auspices of asymmetrical federalism (McGarry and O’Leary 2005, p. 273).

The developing consensus in contemporary writing on federalism is that democracies marked by deep national diversity must embrace multinational federalism and put in place institutions that reflect, respect, accommodate, enrich, and protect

this diversity. Paradoxically, very few multinational democracies have institutionalized multinational federalism, and those that have undertaken this project have done so only in a symbolic manner.

There are three potential roadblocks to the full realization of multinational federalism. First, national/central/federal governments have unitarist or centralizing tendencies, and consequently, they rarely accept that subnational governments are their equal partners. Second, both majority and minority *demos* tend to favor the status quo and to be averse to revisiting and revising constitutions. Third, the biggest roadblock to the full realization of multinational federalism is the rise and mainstreaming of right-wing populist political parties across developed democracies. These political parties are united in their opposition to “globalism” and, most importantly, by their mobilization of mono-national ideas of belonging. Their continuing success in electoral politics in Europe as well as in North America therefore presents a real obstacle to the institutionalization of multinational federalism in these continents.

Overcoming the roadblocks to creating multinational federations can help to empower national minorities. However, the design and implementation of multinational federalism may also prove to be problematic, particularly as it concerns the accommodation of other minority groups. Multinational federalism is rooted in a “multinationalism” that has been severely critiqued because it fails to recognize the distinct cultures of minorities borne out of individual and familial immigration as well as those of collective identities founded on lifestyles, gender, and sexual orientation (Karmis 2003, pp. 95–98). Proponents of federalism are therefore faced with new and challenging ethical considerations in the age of migration and minority mobilization; they must not only imagine how to preserve unity in states with multiple *demos* but also envisage the means to fully protect the diversity of all minorities. In brief, ensuring federalism’s promise of institutions that fully embody the dual values of unity and diversity is a complex and ongoing project.

groups to proceed by lobbying. EU consultations and legislative procedures have increased, allowing inputs from member states, regional authorities, EU agencies, professional bodies, trade unions, citizen-driven organizations, etc. In such context, while there are probably as many definitions of lobbying as there are lobbyists, all definitions should nevertheless refer to the process of influencing decision making. Even though the content and boundaries of the concept remain unclear (Coen 2008), lobbying is a political process which aims to influence public policy and resource-allocation decisions within political, economic, and social systems and institutions. Lobbying is a paid activity with the purpose of influencing decision makers toward a desired action often related to legislation. Actors on both sides of the Atlantic are using synonyms like advocacy and public affairs to distinguish between “public” and “corporate” interests or to minimize the content of the activity. Many professionals choose to designate their activity according to the perception of “lobbying” by the public.

In Brussels, particularly since the Lisbon Treaty (2009), the way European institutions are functioning provide many possibilities for interest

## Introduction

The importance of lobbying, long established in the USA and more recently in the European Union raises many critiques. This entry, in a comparative perspective, presents the regulations of the European Union and the USA. It illustrates differences on this subject, which are central in our societies structured by influence techniques and the primacy of communication.

Two values appear as fundamental with respect to lobbying, namely, transparency and accountability.

Ethics, connected to morals, is characterized by normative, prescriptive, or evaluative statements. This entry briefly presents the laws and codes of conduct developed by the European Union and by the USA for the regulation of lobbying. It also summarizes the activities of many NGOs whose actions result in monitoring and the establishment of programs. Finally, it raises tensions between values, ethics, actors, and practices.

## Regulation Within the European Union

According to the European Parliament, lobbying is defined as “all activities carried out with the objective of directly or indirectly influencing the formulation or implementation of policy and the decision-making processes of the EU institutions, irrespective of the channel or medium of communication used.” These activities include, inter alia, contacting members, officials, or other staff of the EU institutions, circulating information – including written material, organizing events for which invitations have been sent to members, officials, or other staff of the EU institutions.<sup>1</sup>

In Brussels, lobbying focuses its actions and its legitimacy on delivering information to civil servants of the Commission and to politicians, mostly members of the European Parliament. These two latter groups argue that they need information in elaborating laws or during votes at the Parliament. The political process in the European Union is divided between three actors: the Commission which initiates directives, the Parliament which votes, and the European Council, representing the member states. Finally, treaties at the EU level do not define lobbying and its regulation.

### A Transparency Register

In order to develop a knowledge base on lobbying, the Commission and the Parliament have established a unique register. Since 2011, the register aggregates actors into six categories and on January 3, 2018, included 11,607 entities, namely:

- I – Professional consultancies/law firms/self-employed consultants: **1,328**
- II – In-house lobbyists and trade/business/professional associations: **5,746**
- III – Nongovernmental organizations: **3,041**

IV – Think tanks, research and academic institutions: **893**

V – Organizations representing churches and religious communities: **51**

VI – Organizations representing local, regional, and municipal authorities, other public or mixed entities, etc.: **548**<sup>2</sup>

On a voluntary basis, actors have to register into one of such categories. The register exposes the EU activities covered, the number of persons involved and the ones accredited to the European Parliament premises, the field of interest, and financial data. This register also contributes to identifying meetings with Commissioners and Members of the European Parliament (MEP). A code of conduct connected to the register is signed at the end of the procedure of registration. The most important points of the code of conduct are the necessity to identify meetings with officials and institutions, to indicate the organization represented, the objectives of the meeting, the interests involved, and the names of the clients.

For more efficiency, since December 1, 2014, commissioners are required to publish on their websites contacts and meetings with interest groups on topics related to European policy and its implementation. The NGO *EU integrity watch* is monitoring this activity by listing meetings with lobbyists that EU commissioners report and the MEPs' declarations of financial interests.

In 2017, the main results are visibility of actions of interest groups, a better empowerment of European institutions, and the possibilities of NGOs and citizens to raise their awareness on European mechanisms and decision procedures. The president of the European Commission, Jean-Claude Juncker, would like to make the register compulsory for the institutions (Commission, Parliament, Council), nevertheless the legal base is lacking in the European Treaties and the activities of the Council are not yet concerned by the register.

<sup>2</sup> Source: <http://ec.europa.eu/transparencyregister>

## USA: Regulation Based on Checks and Balances

In the USA, lobbying is defined as “the act of directly expressing your views to elected officials in order to influence the action of that person or persons with the goal of affecting the law” (Libby 2012, in Scott 2015, p. 18). Lobbying relies on the possibilities of grievances and petition proposed by the first amendment of the USA: “Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.”<sup>3</sup>

In Washington, the places for lobbying are the Congress, federal agencies, and the Supreme Court. Four acts regulate lobbying activities: *Federal regulation of lobbying act* (1946), *Lobbying disclosure act* (1995), *Honest leadership and open government act* (2007), and *Federal lobbying disclosure act* (LDA) (2008). The legislation defines a lobbyist, lobbyist activities, registration procedures, filing requirements, and the penalties in case of noncompliance.

## A Register for Transparency

The need to register as a lobbyist depends on a threshold of expenses. Above a certain level, the lobbyist should register at the Office of the Clerk of the United States House of Representatives.

Professional consultancies, law firms, and corporations should indicate if they hire former civil servants for federal agencies. The register obliges lobbyists to indicate their clients and the expenses for performing their tasks. They should file a report every 3 or 6 months. Lobbying in the USA is structured by checks and balances, where the influence of one group is ostensibly counterbalanced by another interest group, according to the theory proposed by James Madison (Federalist papers n° 10). The equilibrium is

believed to be in the general interest of society and contributes to enhancing the decision-making process. Behind this model, where separation of powers theoretically contributes to an equilibrium, reality shows more complexity. The means, actions, and quality of information provided varies according to the actors, the sectors they work in, and their ethics.

## Focusing on Values and Ethics: Regulation by Law, by NGOs, and by Citizen-Driven Initiatives

The European Union is a multilevel governance institution and, more precisely, a hybrid of inter-governmental and supranational institutions where the members of the Commission do not have to run for office. The US system, even with numerous agencies and federal organizations, focuses lobbying actions on the Congress, where its members seek public office and have to be reelected.

An interinstitutional agreement (IIA) is the framework that rules lobbying in the EU. In the USA, as previously mentioned, four statutes apply. The IIA focuses on three main issues: the quality of the register linked to access to Members of Parliament (MP), the existence of a code of conduct, and the waiting period before switching from administration to lobbying activities and vice versa.

To improve regulation according to democratic values, two other channels exist: one by NGOs and another by citizen-driven initiatives. At the EU level, two NGOs based in Brussels are “lobbying” against lobbying: Alter-EU and the Corporate Europe Observatory.<sup>4</sup> In Washington, at least two similar organizations exist, namely, Open Secrets and Citizens for Responsibility and Ethics.<sup>5</sup> These NGOs focus on the debate regarding lobbying with respect to making an inventory of MEP and Congress members’ activities. They provide reports explaining lobbying and argue for better regulation and transparency through the

<sup>3</sup> Source: [www.law.cornell.edu/constitution/first\\_amendment](http://www.law.cornell.edu/constitution/first_amendment) (January 2018).

<sup>4</sup> [www.alter-eu.org](http://www.alter-eu.org) and [https://corporateeurope.org](http://corporateeurope.org)

<sup>5</sup> [www.opensecrets.org](http://www.opensecrets.org) and [www.citizensforethics.org](http://www.citizensforethics.org)

registering of meetings between lobbyists and decision makers. By shedding light on lobbying activities, NGOs, especially the European ones, use a “blame and shame” register and focus their actions on corporations.

Citizen-driven initiatives use open data for a better governance. Such initiatives use available data to develop a platform and analyze and monitor the activities of the MPs.<sup>6</sup> These initiatives insist on evaluation of behaviors (presence, absence in parliament), votes (for, against, abstention), and the policy positions of MEPs and congressmen. The key word is accountability, which in liberal democracies, has become an important issue in the last 10 years.

Values may be seen as a point of view from which a person evaluates social behaviors. In this sense, regulation of lobbying in liberal democracies reflects two elements: first, the commitment of a profession to organize itself through a code of conduct; then second, the degree of acceptance of a population toward lobbying activities.

In a profession, the ethical dimension is reflected by the self-imposed obligations that professionals are ready to respect in order to act in conformity with rules. Desmoulin (2017) argues: “individual ethics of lobbyists are based on a fine know how of the law, on a comprehension of the role of the code of conduct in the professionalisation processes and of professional legitimation and of a capacity to regain control of these codes.” It also assumes an awareness of its own values in the eminent subjectivity and the pragmatic acceptance of anxiety and frustrations engendered by ethical concerns.<sup>7</sup> Values and

ethics are enclosed in mechanisms such as transparency of decision-making processes, pluralist expressions of interest groups and systems of control, and evaluation of information provided by lobbyists in official registers in order to reduce the possibilities of manipulation. In an ethical perspective, no registration law nor other sophisticated system can totally avoid pressure on politicians. In the long run, a civilized morality and good governance are key to regulate lobbying.

Elle suppose aussi la conscience de ses propres valeurs dans leur éminente subjectivité, et l'acceptation pragmatique de l'inquiétude et des frustrations engendrées par le souci éthique. (Our translation).

## Introduction

Managing a remote workforce postpandemic presents unprecedented challenges. Employees are demanding their employers allow them to work at home. According to a CNBC article, 64% of the current workforce plan to quit their jobs if they are not allowed to work at home (Smith 2022). Employers are giving in to this demand, given the state of the Great Resignation taking place (Fox 2022). This means that managers, trained and used to manage their employees in the shared physical space, are now faced with managing a workforce they cannot see. As a result of the demanding challenge, feelings of frustration, uncertainty, and even fear occur for the managers now facing this challenge. This is all grim, but with a light at the end of the tunnel. There is a way for this new management situation to be handled and have optimum outcomes. Managing a remote workforce involves three central values: respect, trust, and positivity.

## Values in Remote Management for Best Outcomes

There are two types of prepandemic employees: (1) people who were working onsite in a shared working space with their managers and (2) people who were working online at home performing their job tasks for their online employer. People working onsite were sited to have children cared for at daycare and were used to commuting from their home location to their work location. However, when the COVID-19 Pandemic forced the closing of offices and businesses, mandating that everyone “shelters at home,” nearly 48.7 million people realized a new working experience, most of whom were used to working on site (Coate 2021). Suddenly, and without warning or preparation, these 48.7 million people were working online performing job tasks online working from their living room, kitchen, garage, basement, family room, kitchen table, or somewhere at home where they could have separation from the rest of the family who were also at home.

The mandated “at home” order meant that everything was happening at home, including schooling for children, which presented a challenge for even those who were already remote workers working at home before the lockdown. Working at home while the children are at school is what those remote employees were used to; so, when the lockdown occurred, they too felt overwhelmed with the working at home now mandated for everyone. Both types of prepandemic employees experienced unfamiliar challenges with the lockdown, forcing work performance to take place remotely, children home from school, prohibited from leaving the house except for getting groceries or picking up an order of prepared meals that were brought to the curbside, and other happenstances because of this pandemic. It was a strange and very unfamiliar circumstance to all employers and employees.

Because of the lockdown and people could not travel, businesses in the travel, hospitality, and restaurant industry struggled to stay afloat financially but succumbed to the economic downturn and were forced to close. Other companies and businesses in different industries followed suit, and because of these closings, thousands of people lost their jobs. In these crises, employers and employees working from a distance were forced to find a way to stay connected in cyberspace.

“You are muted” became the familiar phrase during online meetings that were forced to occur due to the lockdown. Online Zoom, WebEx, Google Hangout, and Facebook Messenger Facetime were used hourly for communications and information sharing to keep the workforce connected between management and their employees. In this crisis, managers and their employees were faced with keeping their working relationship intact despite the physical distance. Emerging values such as empathy, sympathy, and determination were front and center during this period for personal and professional survival. During the lockdown crisis, these values helped employers and employees overcome the formidable challenges of forced remote working. Now that the pandemic has subsided and it is no longer a health risk to work in the same physical space, businesses want

to return to prepandemic conditions, but their employees do not (Smith 2022).

If the pushback from employees was not enough to cause havoc for the employers, there is also a situation where the populous of people do not wish to work. This period is called “The Great Resignation” (Fox 2022). Burnt out from working remotely, scared there is still a health risk looming, people of working age (18–78 years old) have quit their jobs to seek better opportunities. The cost of inflation has caused rent to increase, the cost of gas for the car has exploded, and all other expenses have risen to the point where even earning \$15.00 per hour does not cover the cost of living. Being overwhelmed with all the rising costs and the looming future health scares associated with working near coworkers, people have resigned from their jobs. This Great Resignation poses even a more significant unprecedented challenge to the employers, so much so that they are meeting the demands of the workforce for working at home postpandemic, creating a remote workforce forcing the management of remote employees.

Working at home remotely postpandemic for employers means their management must manage people they cannot see, which is not what they were trained to do. Their training was based on being able to share the same workspace with their employees. Consequently, the management of onsite employees, with imposed and expected values such as commitment, dedication, diligence, and the like, is not the same values that must be front and center when managing a remote workforce. When managing people, you cannot see and work remotely; the three central management values need to be respect, trust, and positivity.

### **Values for Management of a Remote Workforce**

When managing a remote workforce, respect, trust, and positivity are managers’ values. Employees working remotely need to feel respected and trusted by their employer to have an organizational commitment. An article written by Ed O’Boyle showed findings from a workplace

survey indicating one common need and expectation among the working generations. One common need and expectation is that “the organization cares about employees’ wellbeing” (O’Boyle 2021, p.1). The need to perceive their employer cares about them, what they are going through in their personal lives, and how that impacts their job performance is critical in the working relationship between a remote employee and an online employer (Cetin et al. 2015). When this caring and compassion is perceived, it is natural for the remote employee to have dedication, diligence, organizational commitment, and want to perform well for their employer. By managing with respect and trust, the remote employee feels they are accepted and valued and cared for.

Positivity is also a factor when managing a remote workforce. Managers of remote employees need to exude positive vibes, even from a distance, for their employees to feel safe, secure, and satisfied with their relationship with their employer. That means the manager needs to manage their employees working remotely differently than initially trained. The first of these three values is one of the most important values a manager can have toward their remote employees, and that value is respect.

### **Respect**

“Organizational respect can be understood as recognizing an employee’s worth and contribution” (2020, p.1). Respectful engagement by the manager includes sustained actions of supportive behaviors, including attentiveness and appreciation. Most remote employees want to know in their minds and feel it in their hearts that they are contributing value to their work and there is meaning in their work. Managers who communicate that with articulation and visible actions foster a work environment that includes affective commitment, closeness, and connectedness, leading to cooperative collaboration. Remote teams, most significantly, need to feel the close connectedness and cohesion from a distance that compensates for the absence of a shared physical workspace. With this respect, remote employees are accepting and

responsive to their managers. Also, with this respect taking place, building the next central value of trust in the working relationship between online employers and remote employees is more achievable.

## Trust

Trust is defined as “assured reliance on the character, ability, strength, or truth of someone or something” (Merriam-Webster) and was the topic of debate among employers’ prepandemic. “How can we have employees working remotely and trust they will do their job, be accountable and productive?” (Gupta 2020). This was why employers, prepandemic, pushed back on allowing their employees to work at home. However, working at home during a time of lockdown, maintaining, and, in some cases, working with greater productivity and a high level of accountability put to rest the argument against the viability of having remote workers. Trust was built and maintained when managers had to ease the reins remotely. Psychological capital such as trust directly correlates with affective commitment, loyalty, dedication, job satisfaction, and employee retention (Norman et al. 2020). Relinquishing control and beefing up communication are two ways to build trust in the management relationship between online employers and remote employees. Having workers working out of view means that they are responsible for the work they produce without the watchful eye of their supervisor. With the trust maintained and appreciated, there is a natural progression to the third value of positivity.

## Positivity

This is a forgotten value in management, yet it is a substantial value that needs to be included when managing a remote workforce (Shahid and Muchiri 2019). Positivity is referred to as being positive or optimistic in attitude and belief. This value creates a pleasant and attractive working environment where creativity, innovation, and

collaboration thrive (Losada and Heaphy 2004). Having a positive attitude exuded in word and deed fosters a working relationship between the online employer and remote employee filled with possibilities that otherwise would not exist. Options such as fresh new ideas that could enhance productivity lead to more excellent values in the marketplace. Imagine what this could mean to the company and its place in the industry. Additionally, having a positive working environment is one that the remote employees are likely to appreciate, enjoy, and not want to leave. When employees, especially remote employees, are leaving their managers as the reason for leaving their company, it is imperative to manage with positivity.

## Optimum Outcomes

When managing a remote workforce with the values of respect, trust, and positivity, outcomes such as affective commitment, high levels of satisfaction, loyalty, trustworthiness, dedication, diligence, reliability, and dependability are likely to occur. Retaining the workforce of qualified and motivated employees, especially when they are working remotely, is the responsibility of the management. In an age when technology is advancing and readily available, and when remote employees are searching for companies that care about them, this is the time for managers to manage their remote employees with respect, trust, and positivity, thereby demonstrating their care for their wellbeing and the appreciation for the value of their contribution. With this caring and gratitude, remote employees are likely to remain. They wholeheartedly contribute toward the success of the company and their career success, making this working arrangement a win-win for all.

## Values-Based Consumption

Caroline Doran

School of Economics and Business

Administration/ Organizations and Responsible Business Department, Saint Mary’s College of California, Moraga, CA, USA

## Synonyms

Conscious consumption; Consumerism; Ethical consumerism; Ethical consumption; Ethics based consumption

## Definition

Values-based consumption is the notion that consumers use attributes beyond convenience, brand, functionality, and price in deciding what to buy or not to buy. Values driven consumers buy products and services in keeping with their economic, social, and ecological concerns.

When Starbucks announced on January 29, 2017, that the company would hire 10,000 refugees over the course of the ensuing 5 years, CEO Howard Schultz may have been acting from personal feeling about the actions of President Trump in the preceding days. But he likely also intended to stimulate values-based consumption. Values, here, refers to ideas about what should be valued by consumers in society, rather than the dictionary definition of values, which might suggest consumption congruent with any kind of motivation, including power values, achievement values, or self-direction values (see Swartz 1992 for a detailed description). The commonly accepted meaning of values-based consumption is more in keeping with the term “ethical consumption.” So in terms of the Starbucks example above, people who oppose the United States’ changed policy with respect to refugees might be motivated to purchase Starbucks coffee because of the announcement; that is, consumption of Starbucks products accords with their ethics.

As the example suggests, ethical consumption is not the same as “consumer ethics.” Consumer ethics encompasses a wide range of consumer behavior not limited to, but including, such concepts as accepting more change from a Starbucks’ cashier than is owed, or not telling the Starbucks cashier if the price that is rung up for an item is lower than the actual sales price. Ethical consumption describes the antecedents to and the act of consumption of an ethically designed and produced good or service. Ethical desires emerge across the many phases of consumption such as needs assessment, information gathering, shopping behavior, decision making, and finally the disposal, reuse, or recycle of the good. Moreover, ethical consumption can also take a more circuitous route as in the example of Starbucks above. In this case, ethical consumers would choose to support the ethical behavior of the firm from which it consumes; a firm or cause with which they believe themselves to be ethically congruent.

When consumers recognize a disconnect between their ideal state and their reality, they develop a desire for goods or services. This need does not need to be satiated unless the consumers find that disconnect to be a problem. If consumers find that a purchase needs to be made then they evaluate product choice, product attributes, and whether or not these products will improve their lives. For ethical consumers, their purchasing decisions factor in product attributes beyond functionality, esthetics, price, or availability. The disconnect between their desired state and their reality relates not only to a personal need but also to the degree of dissonance they experience in the world. Values-based consumption allows them to buy and consume in a manner fitting their beliefs. If they are concerned, for example, about the impact of their consumption on the health of the earth, they may purchase products that offset that concern. In effect, ethical consumers do not only consider the product in the decision but the materials that went into making it, how, where and by whom it was made, how it made its way to the point of purchase, and/or what will happen to it when it comes time to dispose of it. Ethical consumers attach weight to their

purchase beyond utility; often this is a social or environmental meaning and impact.

## Contemporary Consumerism

The trend toward consumer activism reflects the idea that there is a moral minimum by which individuals and institutions should act to prevent negative social and ecological consequences. The term has often been taken to signify just a concern for the environment because the much of ethical consumers’ attention focused on environmental issues throughout the 1980s and 1990s.

Ethical consumption reflects a growing consumer interest in the social and environmental outcomes of production and consumption levels. Just as it leads consumers to select products they consider ethical, it leads them to withdraw their interest in products they consider unethical. When consumers organize group ethical consumerism, they engage in practices known as boycotting and buycotting. For example, consumers who objected to the labor practices of Nike initiated a boycott in the 1990s to compel the sneaker company to abandon its sweatshop practices. In another example, consumers who objected to a boycott of Chick-a-Fil related to the allegations of homophobia conducted a buycott in which they patronized the restaurant on a designated day.

Some of the issues of concern to ethical consumers are:

- Working conditions in developing countries
- Inequality between the needs of disadvantaged producers and business in developed economies
- Over extraction of natural resources
- Pollution
- Biodiversity loss
- Desertification
- Climate change
- Global warming
- Water shortage
- Concern about excessive consumption in excess of what is needed to sustain oneself
- Genetically modified organisms
- Plastic use

- Excessive landfill leading to environmental degradation
- Animal rights
- Factory farming
- Chemicals used in production

Which issues the very diverse set of ethical consumers will take up depends on a complex set of factors. Values-based consumption is complex and the antecedents to such behavior might include personal motivations, locus of control, perceived consumer effectiveness, price, willingness to pay more to achieve a values-based objective, world-views, availability, the range and scale of the problems, fear of being fooled by opportunistic firms, moral blindness, information overload, education, and demographics, just to name a few. Ethical consumer demand has grown for:

- |                                                                    |
|--------------------------------------------------------------------|
| • BPA-free plastic                                                 |
| • Cage-free chicken                                                |
| • Clothing made with sustainable or recycled materials             |
| • Community trade products                                         |
| • Cradle-to-cradle certified products                              |
| • Fair trade products                                              |
| • Fuel-efficient cars                                              |
| • Natural cleaning products                                        |
| • Meat-free food alternatives                                      |
| • Natural makeup and skincare products                             |
| • Pasture-raised meat                                              |
| • Products certified not created by forced, child, or bonded labor |
| • Rain Forest alliance certified products                          |
| • Reusable shopping bags                                           |
| • Solar powered products                                           |
| • Stainless steel and glass water bottles                          |
| • Sustainable flooring, furniture, and homes                       |
| • Sustainable palm oil products                                    |
| • Tiny houses                                                      |

The fact that the market offers a wide array of products for the ethically minded consumer to choose from, may force individuals with budget constraints to create a hierarchy of the issues. Given that some ethical products are more expensive than regular alternative supporting one cause may prevent consumers from supporting another. This might lead consumers right back to a state of dissonance. Furthermore, as some of these products are not widely available in more mainstream

distribution channels may be enough to dissuade the ethically minded consumer from consuming ethical products when they face other lifestyle challenges like time constraints. Finding the time to source ethical product alternatives and travel to buy them puts two forces in opposition: time and ethics. This distinction between consumers' ethical product preferences and not actually buying ethical products is often described as the ethics gap.

## Conclusion

Consumers hold business responsible for overuse of resources, pollution, and exploitative labor practices. Businesses might respond that consumers demand ever increasing improvements in their products without consenting to higher prices. In reality, both parties, as well as government oversight, are necessary to develop models of business and consumption that are both fair and sustainable. While “buy nothing” policies in theory seek to circumvent this reality, the large unmet demand in developing economies, as well as other factors, makes this a limited strategy. There are many social and political reasons to encourage a sustainable level of consumption. Values-based consumption seeks to achieve this level while mitigating its effect on the environment and society.

In addition to consumers, businesses, and governments, scholars have a role to play in addressing the negative consequences of consumption. The ethical consumer movement dates to the 1700s; scholars would do well to explore this history so that the contemporary movement can learn from it. Kassarian's look at attitudes toward environmentally friendly fuel (Kassarjian 1971) preceded the fierce uptick in research on other forms of ethical consumption. This interest from scholars must continue at an even more intensive pace given the gravity of the problems in the natural world and in societies across the globe.

## Values-Based Management Theory

Nicholas J. Beutell

School of Business, Iona College, New Rochelle, NY, USA

## Synonyms

Actionable values; Core values; Managing by values

## Introduction

Values-based management is defined “as a series of interconnected managerial activities to ensure the acceptance of relevant organizational values inside and outside the organization” (Jaakson 2010). The theory holds that human values are at the core of managing organizations. Managers’ help to identify and support shared values within and outside of the organization (Fig. 1). The centrality of values in this theory of management stands in stark contrast to more mechanistic, bureaucratic, and scientific views of management as an “objective” science with little regard to human values, needs, or desires. The values-based approach posits that human values drive the mission, goals, and objectives of organizations and inform leadership, strategy, decision-making, ethics, and social responsibility. In short, human values underlie and are manifest in all aspects of managing organizations and, indeed, human organizing represents a direct expression of values.

In its purest form, values-based management argues that values inform every aspect of organizational functioning. From values, flows everything else. The organization’s mission is perhaps the most crucial embodiment of and expression of deeply held values. The values-based mission, in turn, permeates all other areas of the organization. Identifying, aligning, and behaving in accordance with organizational values requires diligence and perseverance.

## Values-Based Management Theory,

**Fig. 1** Values-based Management Theory

- Values drive mission and vision
- Values statement declares organizational values in writing
- Values statement is shared with all stakeholders
- Managers identify and support shared values
- Espoused values and values in-use must be aligned
- Values inform all organizational processes
- Ethics and values are connected
- Values influence employee attitudes and behavior
- Values affect the bottom line and accountability
- Embracing shared values creates competitive advantage

The recognition of the significance of values in management is hardly surprising. Values comprise the very basis for human existence. Values are defined as core beliefs about what is important in life. Values are considered to be the deepest level of personality and values find expression in attitudes, needs, and expectations (Natale et al. 2004). Values are one of the few variables that are studied in all social sciences and are now recognized as a major component of successfully managing people and organizations.

## Individual Values

Individual values are the ideals that have significance throughout life. Personal values are formed in early childhood and are affected by the values of parents, family, religious participation, and the environment. Values represent rules that guide an individual's priorities and actions. Values underlie motivation and behavior across social settings. Living in a manner consistent with one's personal values increases the likelihood of a satisfying and meaningful life. Values emerge from personal experiences and challenges. Values reflect inner growth and personal development in different phases of life.

Values are relatively stable in contrast to attitudes that are more changeable and malleable. Several arguments have explained the stability of values. Rokeach (1973) suggested that values develop in isolation from each other in an "all-or-nothing" fashion. This type of absolute learning is presumed to be strong and durable. Others have noted that values acquisition requires energy, effort, and discomfort. People want to keep things that they struggle to acquire (effort-reward theory). Further, values are rewarded on a partial

reinforcement schedule making them resistant to extinction. However, over the course of a lifetime, new values and priorities develop, making it important for people to rediscover and remain in touch with their values. There is a tendency for values to become more conservative over one's life such that excitement is valued in youth while a quieter, more predictable environment is valued later in life.

Values at the individual level have numerous conceptualizations, realizations, frameworks, and typologies (Ramburuth 2013). Yet, there is a general recognition that values are a critical determinant of individual, social, and organizational behavior. The adage "know thyself" is essentially referring to the understanding of the values that one holds dear. Values can be quite broad such as those identified in the *Study of Values*: Theoretical (truth), Economic (what is useful), Aesthetic (form, beauty, and harmony), Social (love of people), Political (power), and Religious (unity). Values can also be differentiated by their consequences. Rokeach (1973) postulated instrumental values (relating to personal conduct) and terminal values (relating to desirable end states in life). Examples of instrumental values include being logical, helpful, and self-controlled, whereas terminal values are wisdom, an exciting life, and a sense of accomplishment. Rokeach (1973) proposed a relationship between instrumental and terminal values such that instrumental values are associated with the attainment of terminal values.

## Values in Organizational Context

*Individual values at work.* Individual values are quite important in the work domain as well (Meglino and Ravlin 1998). The exact connection

between individual and organizational values has been considered in the literature (Jaakson 2010). Organizational values are widely recognized particularly with respect to organizational culture. Yet, organizations as legal entities and abstract representations do not have intrinsic values in the same sense that individuals do. The way in which individual variables affect the organization and organizational values affect individuals needs to be explicitly identified. Are organizational values the modal values of all organizational members or are such values completely unrelated and independent of each other? How does values-based management solve this quandary?

Consider an individual joining a work organization. There are two essential matches that relate to how an individual “fits” their work environment: (1) knowledge, skills, and abilities fitting the requirements of the position; and (2) individual values meshing with organizational environment and culture. The vast majority of involuntary turnover decisions (i.e., the employee is terminated) involve a mismatch between the employee’s values and corporate culture. Being qualified for a job is a necessary but insufficient condition for successful adjustment in an organization. Personal values play a big part that transcends qualifications. Values connect the employee to the organization affecting motivation, satisfaction, and organizational citizenship behaviors (i.e., those that go beyond the position description). The foregoing highlights the importance of considering prospective employees’ values during the onboarding process.

*Organizational values.* Values comprise the basis for an organization’s purpose and ideals. Values underlie all organizational cultures whether explicitly identified or not. Increasingly, clarifying organizational values is related to overall organizational effectiveness. As stated above, organizations do not have values per se although an organization, via its members, can identify and embrace a set of shared values. Values-based management is defined “as a series of interconnected managerial activities to ensure the acceptance of relevant organizational values inside and outside the organization” based on Jaakson’s (2010) managing by values framework.

Organizational values can be conceptualized as a hierarchy where the top level is the values statement shared with all organizational members, stakeholders, and society. Such values are also termed espoused values. In a sense, the values statement is the tip of the values iceberg. Yet, these guiding values are touchstones for all values-based processes in the organization. Ethical values of the organization should be considered in the values statement as well. This set of values is explicit and formalized in written company documents. Companies should engage in a process to identify their unique values, those that they want to be known by. Taken as a whole, an organization’s values transcend but inform the mission and vision statements of the organization (Fig. 1).

In addition to espoused values, the implementation of organizational values is termed values in-use (Argyris and Schon 1978). This refers to the manifestation of values in decision-making, leadership approaches, strategy implementation, human resources practices, etc. (It is beyond the scope of this entry to review the myriad of values models. We refer readers to Jaakson (2010) for a detailed discussion.) Alignment of values in-use with the values statement is essential. There is no universal set of values that will ensure organizational success or survival. However, ethical and well-being values appear to be related to positive workplace behaviors (Jaakson 2010).

Ideally, individual, team, and organizational values would be identical or isomorphic. This is aspirational in the face of increasing corporate diversity. There will always be some degree of divergence between espoused organizational values and values in-use by organizational members. It is important, however, that employees embrace organizational values, even when such values are not in exact alignment with their individual values. Noticeable divergences between espoused values and values in-use can be problematic since stakeholders are quite sensitive to the gap between published values statements and the behavior the organization and its employees. Awareness of values alignment is an essential component of values-based management (Blanchard and O’Connor 2003).

Values are often considered with respect to organizational culture. Organizational development models consider values as a central variable affecting organizational change interventions. Cultural change, such as the pursuit of new organizational strategy, largely depends on employees' awareness of their personal values in relation to organizational values, and how these align collectively with the organization. Without this alignment, organizational changes are more difficult.

## Examples of Values-Based Management

Two notable examples of values-based management models are Blanchard and O'Connor's *Managing by Values* and Zappos' model of actionable values (values that can be used to hire and fire people, inform decisions, etc.). Both of these examples reveal how values can be used to shape and inspire entire organizations.

*Managing by Values.* The managing by values (MBV) concept was inspired by Naisbett's "Fortunate 500," a play on words for the Fortune 500, a ranking of companies based on their economic success in the corporate world. The "Fortunate 500" goes beyond economic success by focusing on the quality of service companies provide to their customers and the quality of life of their employees. MBV (Blanchard and O'Connor 2003) has three essential components: identify core organizational values; communicate/share these values; and align all organizational processes with your values.

MBV, like any corporate intervention, requires the support and participation of top management. Employees at all levels must be honest and open about what core values should be embraced. This is a critical step and it does take time. Blanchard and O'Connor (2003) argue that values should be prioritized as well. In effect, values are identified and ranked from most important to least important. Communicating core values follows. Finally, all processes are aligned with values. The alignment process is the most difficult part since the gap between espoused values and values in-use must be bridged.

MBV is a framework and a model for companies to implement values-based management. Successful enactment of MBV positions a company for entry into the Fortune 500. Values are the only boss in an MBV company. The authors posit that MBV is not a program but a way of life. Success means using your values in everything that you do every day. The book (Blanchard and O'Connor 2003) does provide some evidence for successful MBV implementation.

*Zappos Values Model.* Zappos, an Amazon.com company, undertook a corporate-wide effort to identify unique, actionable corporate values (Hsieh 2010). Zappos did not always have a set of core values. The CEO, Tony Hsieh, resisted creating company values because it seemed "too corporate." Initially, the three top executives interviewed all prospective employees for fit with the Zappos culture. The company grew rapidly and it was impossible to scale the interview process. The legal department suggested that corporate values be codified so all hiring managers could use them in hiring.

The process took more than 1 year. All employees were given the opportunity to participate. The company wanted unique values such that doing an internet search for any of their values would yield Zappos as the top search result. The values should also be "actionable" meaning that these values would inform decisions and would be the basis for hiring and firing employees. After various meetings and processes, a list of 10 values were agreed on: Deliver WOW through service; embrace and drive change; create fun and a little weirdness; be adventurous, creative, and open-minded; pursue growth and learning; build open and honest relationships with communication; build a positive team and family spirit; do more with less; be passionate and determined; and be humble. The recruitment department developed interview questions for each of the values. In practice, humility is the most important value in the hiring process. Hsieh stated that "when new employees join the company, they are required to sign a document stating that they have read the core values document and understand that living up to the core values is part of their job expectation" (Hsieh 2010).

The Zappos example illustrates how a company can generate a unique list of actionable values used in all phases of the business. All employees had a chance to participate in the process. By design, the potential gap between espoused values and values in-use is minimal. The values are widely disseminated on the internet, available to all stakeholders. All employees realize the core values are directly related to their performance. Zappos is one of the prime examples of applied values-based management.

## Importance

Values-based management theory acknowledges the important role that human values play in organizations. Values permeate all organizational processes whether or not employees explicitly recognize values. Managers play a critical role in identifying and supporting shared values. Crafting values statements that are real and aligned with values in-use requires diligence and vigilance. Values can be idiosyncratic, inform performance, and lead to choices that are beneficial in the long run. Ethical and well-being values appear to be related to positive organizational outcomes. Values directly influence attitudes, beliefs, and expectations of organizational members. Matching individual values with corporate culture underlies recruitment, selection, and onboarding. Values-based management theory in a nutshell: from values flows everything else.

## Introduction

In 2003, Chinese pharmacist Hon Lik created the electronic cigarette as a way to ingest nicotine in a less harmful way after his father's fight with lung cancer. Shortly after, the device was introduced to Europe (2006) and the United States (2007) as a smoking cessation aid. The new technology also appealed to a new generation: minors. The advertisement strategies by vape companies had the ability to attract a new, younger generation to nicotine. Despite its noble origins, vaping is addictive and brings its own set of health problems to these consumers. Ethical marketing of

Note: All references and guidelines within this article are US.

vaping equipment must balance reaching consumers with protecting a population from a device that may cause them harm. One way to examine this health issue is through the lens of bioethics. Bioethics is a field that evolved in the late 1960s/early 1970s to explore the moral issues of the life sciences. One of its main tools is the four principles of biomedical ethics written by philosopher Tom Beauchamp and religious studies scholar Dan Childress. Applying the principles of autonomy, beneficence, nonmaleficence, and justice to the issue of vape marketing offers cautious lessons to this practice.

## Autonomy

According to Beauchamp and Childress, autonomy derives from the Kantian notion of self-governance, requiring intentionality (self-chosen), understanding, and noncontrol (“be free of controls exerted either by external sources or by internal states that rob the person of self-directedness”, p. 102). In the bioethics version, a person who has capacity can make their decisions as long as they understand the risks, benefits, and alternatives. In other words, personal autonomy requires both “liberty (independence from controlling influences) and agency (capacity for intentional action)” (Beauchamp and Childress 2019 p. 100).

These foundations of autonomy are in opposition to the purpose and goal of marketing – to persuade a consumer into making a choice that they might not have made on their own.

From an autonomy perspective, marketing can *nudge* a person to make decisions they may have made anyway if they had sufficient information, such as knowing a product exists. A potential consumer cannot be *coerced* – have their options limited or be manipulated into developing a desire that overwhelms rational thought. Freedom from control means a person can make their own choices when given truthful and accurate information. They must be free from coercive influences.

In some iterations of autonomy, the health care provider is nondirective, meaning gives the information without telling the patient what to do. In

other settings, autonomy permits a health care worker to share their professional opinion. This points to the difference of “nudging” from “coercing”. Nudging is “any aspect of the choice architecture that alters people’s behavior in a predictable way without forbidding any options or significantly changing their economic incentives.” (Thaler and Sunstein 2008, 6). This is about controlling a choice environment to encourage people to make a certain decision. For example, in cigarette packaging, warning labels in the U.S. and pictures of diseased bodies in Europe are meant to dissuade the purchase. The other end of the influence spectrum is coercion where a person is physically or psychologically forced to make a specific choice. Coercion moves decision-making from a pure autonomy to strong-armed paternalism. Both nudging and coercion are about creating circumstances to direct choice toward a desired end that may not be in the person’s best or self-interest.

The purpose of advertising is to craft a message, to present a vision of reality that persuades a person to act. In many cases, this means emphasizing the benefits and minimizing or overlooking the risks. There are a few circumstances in which risks must be disclosed, such as cigarette packaging and drug commercials on television because marketing historically was misleading (i.e. coercive by circumventing rational decision-making processes). This points to a difference in the autonomy requirement of understanding – not just that a person has been given information but that they comprehend its meaning to their own life. Advertising only gives selective information without assessing understanding, a far lower standard and one that would not meet the stricter requirements of autonomy in bioethics.

In terms of vaping, companies such as JUUL have been accused of not being honest in their advertisement strategies. When JUUL began marketing in 2015, its advertising was accused of targeting a younger audience by using attractive actors and captivating strong colors which would appeal to a younger population. They sold images of lifestyle and fun, which downplayed the true intention of the device – to deliver nicotine. There were also launch parties with popular artists and a

large growing social media following with hashtags such as “#ShareJUUL” or “#GiveJUUL” that generally appealed to a younger demographic. Vape products also tempt by offering a variety of flavors such as bubble gum, mint, melon, and cotton candy that attract younger consumers.

As a result of anti-smoking campaigns, people under the age of 25 are less likely to smoke cigarettes than previous generations (Johnston et al. 2019). They have been exposed to messaging that emphasizes risks to combat the perceived “benefits” that one finds in seeing a celebrity smoke in a film or other marketing. While there is a stigma against the traditional cigarette because of the smell and known adverse health effects, vaping attracts nonsmokers due to the marketing and design of the product and that people do not think of it in the same way. The National Youth Tobacco Survey from 2018 found that 34.2% of high school and 18.0% of middle school students reported using vaping products in the last month whereas only 5.8% of high school and 2.3% of middle school students report cigarette use (Cullen et al. 2019). For these reasons, the FDA in 2020 announced restrictions on the selling of flavors that would appeal to a younger palate.

From an autonomy lens, a person usually gains legal competency to make decisions when they turn 18. However, the brain of an individual does not reach developmental maturity until 25 years of age. Advertising directed at people who are not old enough to legally purchase a product is an attempt to familiarize a population with a product and to go under the rational radar – they develop a fondness for the product, associating it with pleasant memories. Studies show that younger individuals are more prone to nicotine addiction and permanent damage from use. Even with buying restrictions, the colorful advertising and flavors make teens with developing brains and limited rational capacity desire the product, stepping over the line from nudging to coercing. To conform with autonomy, vape advertising must clearly provide the risks and help potential consumers understand (not just be given information) the choice they are making, and be directed at people with fully developed rational brains.

## Beneficence

According to Beauchamp and Childress, beneficence means that “agents must take positive steps to help others” (Beauchamp and Childress, p. 217). In other words what is being done should be of benefit to the person, to make their lives better as well as to take steps to prevent harm. Thus, beneficence first asks what is the benefit to the user? The e-cigarette was created to be a safer form of tobacco consumption and to reduce the health effects of smoking cigarettes and cigars. E-cigarette use is associated with less long-term success in quitting tobacco use, suggesting substitution of one nicotine delivery method with another.

An obligation to do benefit means companies have an obligation to be truthful towards their purpose of selling vapes and must take steps to prevent harm. The principle of beneficence is paternalistic, but in the case of minors, that is not only justified, it is required. Under beneficence, governments are justified in requiring warning labels, limiting sales to certain groups, and controlling the amount of active substances in the vape fluid. For example, in the UK nicotine levels in vape fluid are half of what the USA had when it first launched. There is also a higher tax, more information on the packaging about the negative effects of vaping, and a no advertisement policy on vaping related products; however, they are still available to adults who can benefit. These regulations balance the paternalism of government regulation, self-imposed actions to benefit the consumer, the freedom of a competent consumer to purchase the item, protecting young people from being exposed to advertising intended to move them to buy a product that may be harmful to them, and still being available for those who intend to use it for its alleged beneficial purpose of smoking cessation.

## Nonmaleficence

Nonmaleficence means to do no harm. “The principle of nonmaleficence obligates us to abstain from causing harm to others.” (Beauchamp and

Childress, p. 155). The idea derives from the Hippocratic Corpus which says that not causing harm is a health care provider's first obligation.

Although created to mitigate the harm of nicotine consumption, vaping has been shown to have not only the addictive problems of other nicotine delivery systems, but to have its own potential harms. *E-cigarette vaping product use-associated lung injury* (EVALI) is the term that the Centers for Disease Control and Prevention (CDC) gave to the newly identified lung disease linked to vaping. As of February 18, 2020, the CDC had reported a total of 2807 hospitalized cases and 68 deaths due to EVALI, and the average age of the patients was 24 years (CDC 2020). Those who vape inhale lung-damaging ultrafine particles, toxins, and carcinogens.

A competent adult might be able to waive this obligation for themselves by saying, "I have been told the risks and benefits and I choose to use this product." To make such a choice, though, the consumer would need to know the risks and the benefits. Most ads, merchants, and packaging do not inform consumers about this information. They may also not know that vape products have little to no regulatory control, at least in the USA. In most cases though, the use of the vape product does not just harm the individual, but harms those who are not consenting to the exposure. Second-hand vape smoke impacts the lives of those who have asthma and pregnant women by causing abnormalities in fetal lung development.

One who lacks a rational capacity – children, teens, young adults – lacks the ability to waive this interest that others will not deliberately harm them. Nonmaleficence is a paternalistic concept that someone else knows what is best for you because you are incapable of seeing it or lack information and understanding necessary to make good choices. Advertising geared toward children and teens on TV, radio, online, and social media drive desire for a product whose proper use causes harm and violates professional principles.

According to the American Advertising Federation (AAF) Principle 8 "Advertisers and their agencies, and online and offline media, should discuss privately potential ethical concerns, and members of the team creating ads should be given permission to express internally their ethical

concerns" (AAF 2011). The American Marketing Association (AMA) code of conduct states that marketers must do no harm, embrace ethical values, and be trusted (AMA 2019). The marketing that the vape industry delivers must do no harm. Advertisers and marketers are responsible for their messaging and for what actions those who hear it may take. Companies must be aware of any ethical concerns in their advertising to be transparent with the general public. Thus, when vape companies are catering to minors to build a base of current and future customers, they are not being transparent in their message and putting others in harm's way in violation of their own professional code.

The more that the youth are exposed to advertisements, the more likely they are to become addicted to nicotine and be subject to other harmful chemicals in the vape fluid. According to the U.S. Department of Health (2016), "exposure to e-cigarette advertising on television increased by 321% for young adults (18–24 years of age) and 256% for adolescents (12–17 years of age)". As the advertisement of e-cigarettes rises, so does the use of e-cigarettes among the youth.

The prevalence of using vaping products has risen for those who did not smoke prior to being shown advertisements for e-cigarettes. As a way to combat the use of vapes in the youth, the minimum age for buying a vape was raised to 21 on January 1, 2020. This is a step in the right direction, but the brain is not fully developed until the age of 25 so the effects on the brain are more severe for youth. A 2020 FDA ban removes certain e-cigarette flavors in an effort to crackdown on youth vaping (FDA 2020). When looking at vape advertising, nonmaleficence suggests an obligation to not sell a product, or advertise a product, whose use as directed would knowingly cause harm.

## Justice

The principle of justice requires treating people equally, fairly, and impartially (Beauchamp and Childress). This principle draws on the Aristotelian notions of "fairness in distribution" and "treating likes alike and different differently."

This is the one principle that focuses on the community perspective. For example, if this is truly a device meant to help people quit smoking, then it should be treated like other medical devices and require a physician prescription.

One point of comparing likes alike can be seen in viewing how countries outside of the USA deal with these products. While in the USA, a JUUL pod contains 59 mg/mL of nicotine (equivalent to one pack of cigarettes); in the UK, there is a limit on nicotine content at 20 mg/mL. The EU also restricts vape product advertising on TV, radio, print, and online.

If e-cigarettes are more like traditional cigarettes than they are different, then justice suggests that vaping products should be subjected to the same rules, oversight, and regulations that fall upon analog smoking devices. There is much in common between cigarettes and vapes, but one big difference between them is that vapes can still be advertised. Since April 1, 1970, cigarette ads have been banned from being aired on television or radio in the USA. There have been further restrictions of tobacco companies since then and the number of smokers in the USA had declined from 42% in 1965 to less than 17% in 2018, which could be driven by both health warnings and high taxes (Glass 2018). However, e-cigarettes and vapes can still be advertised on television, print, and radio ads. When it first launched, JUUL relied heavily on social media to appeal to new people, especially minors, with flashy colors and other advertising tactics. Although the e-cigarettes are seen as a safer alternative when compared to traditional tobacco products that produce tar, nicotine is still present, highly addictive, and can harm the developing brains of adolescents. The marketing techniques closely mirrored the advertisements of tobacco which raises the question of why it can still be advertised so freely. If likes are meant to be treated alike then the marketing techniques of e-cigarettes should be limited just like traditional tobacco, which includes being banned from TV and radio. After the FDA had called the act of vaping in youth an epidemic, JUUL shut down its presence on Facebook and Instagram, and limited its Twitter to non-promotional tweets.

## Final Analysis

While autonomy is often the driving principle in most situations, it does require a full and truthful sharing of the risks and benefits to allow users to make a rational decision free of coercion. The goal of marketing is often the opposite, to nudge people toward making a decision they may not have made on their own. Advertisements often call on people's emotions, not their reason. An ethical vape industry must strive to be transparent in its advertisement so they do not appeal to minors. Nonmaleficence means that the general public must be informed about the dangers of the products, even though they have the right to ingest what they want. By allowing minors to think these are risk-free and "cool" devices, many minors have become addicted to nicotine. Minors using these products put not only their lives at risk, but act as brand ambassadors as they share on social media, therefore promoting its use to more minors. Not being proven as an effective tool to quit traditional cigarette products, being a potential health hazard, and using marketing that appeals to youth go against the principle of beneficence. Therefore, according to justice, e-cigarette companies should have the same limitations in their marketing as cigarettes.

<sup>1</sup>Institute of Philosophy, Freie Universität Berlin, Berlin, Germany

<sup>2</sup>Institute of Political Science, Freie Universität Berlin, Berlin, Germany

## Synonyms

Climate-friendly consumption; Ethical consumption; Food ethics; Vegan boycotts; Vegan consumerism; Veganism

This work is based on a longer review article that summarizes the results of original articles on the topic (see Beck and Ladwig 2020).

## Introduction

“Veganism” is most commonly associated with concern for animal welfare or animal rights. However, veganism can also be justified from an ecological perspective centered on anthropocentric considerations of justice or collective self-interest. Concerns for individual animals and for the environment converge, not least because animal husbandry has a large impact on anthropogenic global heating. This entry focusses on vegan consumerism as a means by which to minimize harm to animals, humans, and the environment. It entertains a broad understanding of vegan consumerism that also covers attempts to influence political decision-making.

The use of animals is a legally authorized and institutionalized practice, which means that one must consider both responsibility within consumer interactions, and responsibility to reform social institutions and structures. Reforming or eliminating practices that harm animals would require collective action to create more just national and international laws and institutions. Likewise, slowing climate change requires institutional solutions and collectively binding decisions concerning different societal sectors, including agriculture. Governments arguably bear a primary responsibility to ensure climate justice and the morally appropriate treatment of animals and are consequently obliged to strive for international coordination and cooperation. Industry lobbyists attempt to obscure this with deflection campaigns that shift moral responsibility from governments and companies to individuals. But this does not imply that consumers bear no responsibilities at all with regard to climate and animal justice. Governmental, corporate, and consumer responsibilities are complementary in principle, and each warrant an in-depth treatment. This entry is restricted to a discussion of the responsibilities of individuals for the moral consideration of animals and climate justice – not only in consumer interactions, but also in their political roles as citizens. It addresses the overarching question of whether concern for animals, human rights, and/or climate justice entails weighty moral reasons to adopt a vegan lifestyle.

This entry proceeds as follows. First, veganism is situated within the broader field of ethical consumerism. Second, a variety of motivations and justifications for veganism are detailed. Last, criticisms of vegan consumerism are discussed.

## Ethical Consumerism

Ethical consumerism consists of purchasing and consumption choices that are understood as a morally informed response to wrongs in the production and distribution of goods and services. It has a narrow *interactional component*, which consists of consumer choices that are at least partly motivated by moral considerations. *Boycotters* intentionally renounce (or withdraw from) certain kinds of economic interaction. The boycottees can be individuals or organized groups, most typically not only companies, but also an entire industry sector, for example, when vegans avoid all products extracted from animals. In contrast, a *buycott* involves giving preference to products and services on the basis of moral considerations. Both boycotts and buycotts can be individual or organized. Examples of organized buycotts include official vegan certification, such as the European Vegetarian Union's V-label and the Vegan Society's Vegan Trademark. By participating in organized buycotts and boycotts, consumers typically seek to impact the demand for a product or service. Perhaps more importantly, they also take part in collective action, which can have far-reaching sociopolitical consequences. The *political component* of ethical consumerism is revealed when reflecting on what consumers can do to contribute to lasting social change and when the goals and concerns of these campaigns or initiatives are publicly communicated and justified (see Beck 2019). By participating in such campaigns, consumers often simultaneously aim at reforms of the basic institutional infrastructure of consumption, such as legislation that prohibits certain kinds of animal treatment.

Thus, consumers have a political reason to join well-designed boycotts and to support labeling initiatives, as well as the moral reasons given in defense of the interactional component of ethical

consumerism. Veganism is one such example of morally motivated and politically relevant consumer behavior.

## Veganism

The *Vegan Society* (2020) defines veganism as “a philosophy and a way of living which seeks to exclude, as far as is possible and practicable, all forms of exploitation of, and cruelty to, animals for food, clothing or any other purpose.” In the following, the term “animal products” is used as shorthand for all kinds of goods that vegans try to avoid. The definition's restrictive clause “as far as is possible and practicable” is crucial, however, because absolute avoidance of animal products is impossible, given their wide distribution – from tennis balls to medicines tested on animals.

The above definition of veganism refers to the *moral motivation* of avoiding cruelty to animals, but there are also self-regarding rationales for a vegan lifestyle, such as expected health advantages. However, empirical evidence suggests that a concern for animal welfare is the primary motivation for vegans. In a quantitative study among German vegans, the most important motives for becoming vegan are reports from factory farming, followed by climate protection and health considerations (Kerschke-Risch 2015).

However, turning to a vegan lifestyle demands a conscious decision to forgo many conveniences. That raises the question of whether such a radical step is really required due to *valid moral reasons*. Although animal welfare considerations provide the most compelling justification for veganism, anthropocentric arguments are still predominant in moral theory and everyday morals.

## Human Rights and Climate Justice

What anthropocentric justifications can be made for veganism? Human rights claims are broadly accepted as strong moral grounds for excluding certain practices. And today's livestock farming has a negative net impact on human rights-related goods, such as food, water, and health. Conversion to veganism by a significant share of the world's population could contribute to a more

just distribution of the abovementioned human-rights related goods, and also make it easier to overcome world hunger, since animal agriculture is a comparatively inefficient way of creating nutritional energy. A recent meta-analysis found that meat, aquaculture, eggs, and dairy use about 83% of the world's farmland yet provide only 37% of our protein and 18% of our calories (Poore & Nemecek 2018).

The production of livestock also causes water pollution, e.g., by nitrates, pesticides, and antibiotics. The excessive use of antibiotics in animal husbandry indirectly endangers human health by contributing to antibiotic resistance.

Animal husbandry is also one of the main drivers of anthropogenic global heating. According to the Food and Agriculture Organization of the United Nations, industrial animal farming causes 14.5–18% of all anthropogenic greenhouse gas emissions (FAO 2013). Livestock farming also contributes indirectly to global heating as tropical rainforests are destroyed to create soy plantations for animal feedstuffs or pastures for cattle. Deforestation not only fosters the extinction of entire species, but it also releases large amounts of carbon dioxide.

Notwithstanding such scientific findings, anthropocentric reasoning regarding human rights and climate justice does not suffice to show that a vegan diet is morally required. A radical reduction of the number of animals would suffice to reach our climate goals, and in particular, a moderate number of livestock could continue to be raised in grazing areas unsuitable for the cultivation of edible crops.

### Animal Ethics

Consequently, in order to arrive at the more radical conclusion that veganism is morally obligatory, vegans primarily rely on animal ethics. They try to show, first, that at least all sentient animals have a moral status, i.e., they matter morally for their own sake, and second, that existing animal welfare regulations do not take this status seriously enough.

There is still no philosophical consensus on the moral status of animals. The most important objections refer to some version of a mutuality

argument according to which only those individuals have a moral status who are capable of respecting this status in other individuals as well. Thus, in order to be a moral patient, one must also be a moral agent. This requires capacities such as rationality and ability to contract, or compliance with self-given moral laws. Because animals lack these abilities, some argue that they do not deserve moral consideration for their own sake.

Animal ethicists contest the presumed strict reciprocal character of morals with two arguments. First, if only rational and/or morally reasonable persons could have moral status, human infants and severely cognitively disabled adults would not matter morally for their own sake. This is counterintuitive and incompatible with the social scope of human rights. Second, even rational and reasonable persons do not restrict their moral claims to those “higher abilities” that enable them to morally reciprocate. They also expect consideration as embodied and social creatures, with corresponding physical and social needs (see Ladwig 2020). But if characteristics such as the capacity to feel pain or to suffer from social isolation are morally relevant in the case of humans, it seems arbitrary to morally neglect them in the case of nonhuman animals. In everyday morality as well as in law, there is a growing consensus that sentient animals matter morally for their own sake. Thus, harming animals requires justifications proportionate to the losses imposed on them.

Countless animals are confined, hurt, and killed in order that humans may sell and consume their products or their flesh. But there is broad consensus among nutritionists that vegetarian diets are appropriate for all humans during all stages of life, and that also vegan diets can be nutritionally adequate at least for healthy adults. Thus, humans could give up a large percentage of the animal products they currently consume, particularly in affluent societies, and still be capable of leading good and healthy lives. And given that animals matter morally for their own sake, humans should not harm them unnecessarily by purchasing and consuming animal products that are not vitally necessary.

## Criticisms of Vegan Consumerism

These moral reasons notwithstanding, there are a number of objections to vegan consumer activism and its underlying moral claims.

First, in order to be morally recommended or even obligatory for all, vegan consumerism must be generally reasonable. But is a vegan diet really suitable for all? According to the American Academy of Nutrition and Dietetics, well-planned vegan diets are adequate for almost all individuals. This position is shared, e.g., by the Australian *National Health and Medical Research Council*, and the Portuguese *National Programme for the Promotion of a Healthy Diet*. It is nevertheless not beyond professional dispute. For example, the *German Nutrition Society* does not recommend a vegan diet for children or pregnant and breastfeeding mothers. This might indicate that there is presently reasonable disagreement about whether a vegan diet is suitable for all humans.

Second, one could criticize vegan consumer campaigns as lacking legitimacy. Although individuals are arguably at considerable liberty to engage in unilateral boycotts and boycotts of products and services, the same does not necessarily apply to organized consumer activism.

Waheed Hussain (2012) argues that “social change ethical consumerism” must not deprive other citizens of their basic liberties, must be based on a reasonable conception of the common good, must only deal with issues that have not been addressed in formal democratic processes, and must be guided in a manner that is appropriately representative and deliberative. Vegan consumer campaigns that seek to abolish factory farming, or even all animal husbandry, would accordingly not be legitimate, as they aim at the institutionalized treatment of animals, which is not only addressed in formal democratic procedures but which may enjoy wide public support. However, Hussain’s criteria seem too restrictive and would not only disqualify vegan consumer activism, but also a broad range of other consumer campaigns that appear intuitively legitimate. It is more plausible to demand that ethical consumerism should be reflective of power

disparities, sensitive of the views of those they seek to influence, and advance a reasonable conception of the common good (Barry and MacDonald 2018). Organized consumer boycotts should also be proportional, in the sense of targeting producers who engage in comparatively problematic malpractices, and transparent in terms of disclosing accurate information about the campaigners and the malpractices that they target (Beck 2019).

Third, vegan consumerism might be considered causally ineffective. From the perspective of the individual, even a series of choices may seem to make “no difference,” given that producers and service providers usually operate on large scales and are unlikely to be responsive to the quantities involved in individual consumption patterns.

The causal impotence objection poses a challenge to consequentialist reasoning which postulates that those individual acts are morally right which yield the best expected outcomes. However, some consequentialists have responded to this challenge by providing threshold arguments, according to which the expected or likely utility of (failing to) cross thresholds with their choice still gives individuals moral reasons to make certain consumer choices, even though they cannot be certain that they will make a difference. Additionally, consequentialists have sought to justify the interactional component of ethical consumerism with appeals to the role-modeling effects of individual consumer interactions (see Almassi 2011).

The impotence objection is less challenging to virtue ethical reasoning, which is mostly concerned with the moral character expressed through consumer choices, and to deontological reasoning, which requires agents to act according to universalizable maxims. Christine Korsgaard argues that people should be morally concerned about how they are related to particular animals when consuming their flesh or products that have been extracted from them without due regard to the animals’ good. When people decide to buy and consume such products, they treat individual animals as mere means to their own ends, and this is morally wrong irrespective of consequences and numbers (Korsgaard 2018, p. 223).

Finally, vegan consumer campaigns might also be insufficiently effective because they meet with strong ideological and emotional resistance. According to Melanie Joy (2010), consuming animal products is considered as normal, natural, and necessary. This ideology begins to influence almost everyone from early childhood, and it affects not only people's thoughts and perceptions, but also their emotions.

Thus, it might be more effective to promote the moderate steps of adopting vegetarianism or reduced intake of animal products combined with careful sourcing (organic, free range, etc.). If most of the world's population (in particular the growing middle classes and the wealthy) significantly reduced their intake of animal products, the aggregate positive effect would outweigh that of all current vegetarians and vegans. It might also be easier for many people to engage in political activism than to accept the personal consequences of vegan consumerism.

Perhaps the most important aspect of vegan consumerism is signaling one's willingness to engage in collective action. But campaigns for political and social change are most likely to succeed if they are supported by large coalitions of more *and* less radical actors. An obvious goal suitable for such coalition building is the elimination of factory farming, which could unite animal rights activists, environmentalists, and small farmers.

In summary, the duty to adopt a vegan lifestyle depends upon the strength of the arguments from animal ethics, because anthropocentric arguments only support significantly reducing the consumption of animal products and transforming the methods of production. In animal ethics, different arguments justify the conclusion that people act immorally when they impose suffering or death on animals to extract products that are not necessary for leading good and healthy lives. This comes closer to a justification for veganism, although it might still be doubted whether vegan diets are healthy and accessible for all, including poor people in developing countries and groups such as pregnant women even in affluent societies.

Second, the legitimacy and the effectiveness of vegan consumerism as a means to improve morally problematic states of affairs must be considered. Whereas proportionate and transparent vegan consumer campaigns appear to be a permissible method to strive for social and political reform, the impotence objection poses greater problems, at least for consequentialists who argue that the moral value of a conduct is ultimately determined by its (likely) consequences.

Insofar as consequences matter, a large number of vegetarians or people who significantly reduce their intake of animal products might make a bigger difference than a small number of vegans. Meanwhile, vegans can see their consumer behavior as a potential trigger to inspire others to engage in collective action. Thus, they should avoid giving the impression of a sectarian insistence on personal purity. Self-righteousness is not only a vice, but it is also an obstacle to the political coalition-building on which morally required reforms ultimately depend.

## Virtue Ethics

Andy Gustafson and Eric Peterson  
Creighton University, Omaha, NE, USA

## Synonyms

Aristotelianism; Moral character theory

## Introduction

Virtue Ethics very broadly refers to a group of ethical theories that take a person's character to be of central and fundamental importance when it comes to determining what has value and what courses of action one should pursue. Here the essential parts of Virtue Ethics will be explained. Ethics is concerned with how we ought to live or behave. Some of the questions that ethicists reflect on are “what do we owe to each other and why?” “What things have value?” and “What makes for a good life?” At the risk of oversimplifying, Ethics

is the study of conduct, or what counts as appropriate behavior for living and living well. While some theories of ethics emphasize right reason for action or what comes to one's duty and obligation (deontological) and some emphasize the consequences of action (utilitarianism), it is common for ethical theories to focus on finding some foundational principle which grounds all moral evaluation, while virtue ethics emphasizes the moral evaluation of the actor. While many theories of ethics focus on right actions, virtue ethics is concerned more primarily with developing right character and with what is the best way to live one's life overall. This wholistic focus on one's entire way of being is a unique strength of virtue ethics.

## Discussion

To get a basic grasp of virtue ethics requires an introduction to four concepts that are the basic building blocks of a virtue ethics theory. These are Character, Final Ends, Virtue, and Practical Wisdom.

**Character:** Many of us have grown up hearing exhortations to strive to become persons of good character. A person of good character is trustworthy and reliable. In contrast, a person of poor character is unreliable and hard to trust. We can think of “character” simply as the sum total of traits both natural and acquired. Importantly, traits are characteristics that people have, and traits play a role in what people characteristically do. An example should help. Some people are naturally kind, and these people, naturally, do kind things. Some people do not have a kind disposition, but rather have to acquire that characteristic through experience and even hard work. One's character can be formed by many things including one's upbringing and homelife, one's formal education, and one's personal habits. That such formation is possible is because, according to virtue ethicists, we humans have natures that can be perfected (or improved), at least in the sense of reaching a final end.

**Final Ends:** Having a nature that can be perfected really only makes sense on the

assumption that one has a final end – something that one aims at with their life. Everyone has goals they pursue, projects they are working on, and relationships to be investing in. Most virtue ethicists have thought that people pursue all of these things for some ultimate end, what might be called happiness or flourishing, but this end is not pursued for anything else. This is what virtue ethicists have in mind when they talk of a final end. It is quite natural to ask *why* one wants to pursue certain goals or projects, but it seems odd to ask why one wants a flourishing life. Everything we do and pursue in life, we do for a good and flourishing life. It is important to see that talk of a final end should not lead one to think of a final destination (i.e., afterlife) – it is not. Rather, it is more like a journey. This end of a flourishing life can be experienced in one's life here and now. This raises the natural question of “how does one attain a flourishing life?” The answer lies in understanding the concept “Virtue.”

**Virtue:** We live a flourishing life by pursuing virtue or virtuous activity. Virtues are excellences of character (or intellect). Standard virtues are things like courage, justice, generosity, temperance, patience, practical wisdom, and so on. Virtues in certain ways are like skills in that the more we practice them, the more natural they become. Virtues are also like skills in that we usually try to emulate those who are more advanced at certain skills. This is one way that virtue ethics puts much emphasis on moral development. There is the idea of a moral exemplar – a person who is much farther along on their virtue journey. It is common for others to aspire to be like these people. An example can help bring all of this together. Say a person struggles with generosity in part because they are a bit over-attached to money and possessions. It is hard for this person to be generous, but they admire it in others (moral exemplars) and would like to become more generous. At first, practicing generosity through giving of their time, moneys, or possessions would be a challenge. However, like practicing any skill, what begins as awkward and clunky can develop into a smooth and natural activity. The more the person practices being generous, the easier it will become until it seems like second nature to give to

others. This is how all of the virtues work. A person who lacks courage can practice to overcome fears, becoming more courageous. A person who struggles with indulging in pleasures can practice temperance (moderation with regards to pleasures) and become more temperate. Importantly, virtue has both an intellectual dimension – doing the right thing for the right *reason* – and an emotional dimension – doing the right thing with the right *feeling(s)*. To understand this, think of it this way: some people do the right thing knowing that it is the right thing to do, but they actually do it begrudgingly – they do not take pleasure in doing the right thing. In contrast, the virtuous person does the right thing for the right reason and this person *enjoys* doing the right thing. It gives them pleasure to do the right thing. That is virtue requires having an appropriate emotional response towards doing the right thing. This is the emotional dimension of virtue. To understand the intellectual dimension of virtue takes us to the last of the four foundational concepts of virtue ethics.

**Practical Wisdom:** Practical Wisdom is basically reasoning about what is the right thing to do in relation to our goals, projects, and relationships. Practical wisdom is itself a virtue; it is something we can get better at with practice and experience. It is an intellectual virtue that is essential to all of the virtues of character – this is the intellectual dimension of virtue. Back to the example of generosity, there is no simple formula by which one follows to ensure that one is engaging in a generous activity. After all, one could give of their time and money indiscriminately, and it is not obvious that this should count as being generous. (Giving money that enables drug addicts does not count as being generous.) At the very least, for an activity to count as generous, one must know how much to give, to whom, for what purpose, etc. However, knowing these things will not always be easy or obvious and can vary significantly from situation to situation. It often takes much intellectual skill or insight to know these things. This intellectual skill/insight amounts to practical wisdom. Further, this skill is required for all virtues. For instance, one is not courageous for merely being unafraid of all threats. Courage is about having the appropriate amount of fear that the occasion calls

for, but still following right reason when it tells you to take a stand against a particular threat. Once again knowing what the appropriate response and feeling should be in any given situation takes much intellectual skill and insight. This is the way that practical wisdom is a virtue that is foundational to every virtue.

Virtue ethics refers to a group of theories that focus on a person's character as being fundamental to Ethics. We can see how these four basic blocks of virtue ethics build upon one another. A person's character – their natural and acquired traits – is malleable. It can change for better or for worse. Their character, in short, can make or break their life. This is judged against the concept of a final end – a happy and flourishing life. A person's character can either contribute or hinder their flourishing. Flourishing ultimately amounts to living a life of virtuous activity. Virtues are excellences of character (and intellect). Thus, a person's character contributes to a life of flourishing by pursuing the virtues. Virtuous activity is doing the right thing with the appropriate feeling(s) as well as doing the right thing for the right reason(s). What helps one find the right reason(s) is practical wisdom, itself an intellectual virtue. For virtue ethics, one pursues an ethical life so that they can pursue a happy and flourishing life.

### **Contemporary Developments, Traditional Criticisms, and Virtue Ethics for Business**

Although virtue ethics originated primarily from Aristotle's *Nicomachean Ethics* (Irwin 1999) and developed extensively by Roman Catholic Scholars for centuries, virtue ethics was brought into contemporary ethical discussions first by G. E.M. Anscombe's paper "Modern Moral Philosophy" which claimed that ethicists needed to return to Aristotle (Anscombe 1958). Since then, many contemporary ethicists such as Alasdair MacIntyre (1981) and Julia Annas (1993) have done much to help virtue ethics develop and

thrive, while writers like William Bennett have sought to spread virtue ethics to the general public through popular writings (Bennett 1993).

Critics frequently claim that virtue ethics is without focus or clarity necessary to determine which types of actions should be permitted and which avoided. In short, it seems a bit vague. Second, given that its goal is to lead an excellent life, it tends to seem a bit self-focused, and Aristotle's virtue ethics in particular seemed over-concerned with honor and under-concerned with humility, for example. Where to ground the virtues turns out to be a third problem which MacIntyre raised in his book *Whose Justice, Which Rationality?* (1988). Differences between views of the ends and aims of life will certainly provide variant lists of virtues. And more recently, there has been criticisms grounded in experiments from Situationist Social Psychology that purport to raise doubts for the very existence of character or character traits. Naturally, if there are no character traits (one of the basic concepts of virtue ethics), then virtue ethics is a nonstarter.

Despite these concerns, in recent years, many business ethicists also have applied Aristotle and virtue ethics to matters of business ethics. Robert Solomon, for example, has even developed a list of virtues which are especially relevant in business activities (Solomon 2003). Ed Hartman has highlighted the central importance of character and corporate culture in developing moral integrity (Hartman 2013). Alejo Sison has incorporated recent research in economics and happiness studies into his virtue ethics work to show that happiness is "the ultimate value proposition for business" (Sison 2016). Tom Morris famously wrote an entire book entitled "If Aristotle Ran General Motors" (1997). These efforts have sought to show that business activities, when practiced with integrity of character and in accordance with virtues, are much more likely to flourish and bring about success for companies who establish these habits in their company culture. Virtue ethics has become and continues to be a basis of fruitful progress in the field of business ethics.

## Virtuous Leadership

Gordon Wang<sup>1</sup> and Rick D. Hackett<sup>2</sup>

<sup>1</sup>The Centre for Business, George Brown College, Toronto, ON, Canada

<sup>2</sup>DeGroote School of Business, McMaster University Hamilton, ON, Canada

## Synonyms

Character-based leadership; Virtues-based leadership

## Introduction

As part of wide-ranging efforts to better incorporate moral considerations into leadership practice (Lemoine et al. 2019), virtuous leadership is a leader-follower relationship wherein a leader's situationally appropriate expression of virtues triggers follower perceptions of leader virtuousness, worthy of emulation (Wang and Hackett 2016). Although there are many perspectives concerning the meaning of virtue (Newstead et al. 2018), leadership based on the character-based virtue ethics school of moral philosophy (MacIntyre 1984) places less emphasis on the articulation of ethics-related principles and rules (e.g., regulations, codes of conduct, and audits) in favor of focusing on developing and nurturing moral character in leaders themselves, through the self-cultivation of moral virtues — character traits disposing a leader to achieve excellence (Wang and Hackett 2020).

Virtuous leadership includes three essential elements: leader virtues, leader virtuous behaviors, and context.

Leader virtue is a character trait that a leader acquires and maintains primarily through learning and continuous practice and is expressed through voluntary actions undertaken in context relevant situations. There are many types of character traits, and virtues collectively contribute to the “good” character of a leader. Virtues are not innate but acquired through a habituation process in which people continuously learn and practice virtue until it becomes habitual. Of course, habits can be lost due to a lack of practice, which implies that once a leader acquires a virtue, continuous practice is required to sustain it.

A leader displays virtuous actions voluntarily in three senses. Firstly, it is intentional; the leader is aware of the pertinent facts of a situation and the practical wisdom needed for this action. From childhood on, a leader acquires the knowledge of virtues and virtuous acts as taught through formal education efforts and through informal learning from stories (from family, friends, and others in the community). In situations posing a desire or threat, the leader will recall this virtues-based knowledge to prompt a quick moral reaction

without undue hesitation. Secondly, the underlying motive of virtuous action is intrinsic simply because it is virtuous. This implies that a leader displays a virtuous action with the on-going intent of becoming a virtuous person; it is not rooted in fulfilling moral obligation, to gain personal advantage, or to comply with external rules, controls, or compulsions. Thirdly, virtuous action is expressed consistently over time and across contexts, not only because virtues are developed and sustained through continuous learning and practice but also because virtues-based knowledge enables people to recognize the importance of consistent practice across organizational and social contexts, and to therefore act accordingly.

Although a leader displays a virtuous action consistently across different contexts, the meaning attached to the action by an observer may vary with the observer's knowledge and beliefs concerning the virtuous action. For example, the same behavior expressed in one situation may be interpreted as reflecting a particular virtue but may not be interpreted similarly when expressed in a different situation. This implies that virtues can be fully understood only by considering the context of the virtuous act, because what is "right to do" depends on the situation. For example, courage is exemplified in situations that induce fear. The same behavior is unlikely to be considered courageous in the absence of fear.

### **Six Cardinal Virtues for Defining Virtuous Leadership**

To date, many virtues have been mentioned in relation to the moral component of various leadership styles/approaches. Based on a comparative analysis of the overlap between the Confucian and Aristotelian traditions in the virtues-ethics literature, six moral virtues, courage, temperance, justice, prudence, humanity, and truthfulness were identified as the core defining elements of virtuous leadership. In other words, virtuous leaders will express these virtues by voluntary actions in context-relevant situations. Specifically, courage enables leaders to do what they believe is "right" without fear; temperance helps leaders control

their emotional reactions and desires for self-gratification; justice motivates respectful recognition and protection of rights of others to be treated fairly, in accordance with uniform and objective standards; prudence enables leaders to make "right" judgments and choose the "right" means to achieve the "right" goals; humanity underlies leaders' love, care, and respect of others; and truthfulness is reflected in leaders' telling the truth and keeping promises.

These six virtues have five characteristics in common. Firstly, they are all dispositions encompassing "good" character traits that are philosophically distinct from actions and from the other personal traits, such as feelings, skills, capabilities, competencies, moral values, and moral goals (Hackett and Wang 2012; Wang and Hackett 2020). Secondly, they are all considered cardinal by virtues ethicists, which contrasts with the other, often-called corresponding virtues that are commonly regarded as being closely aligned with or founded in the cardinal virtues. In other words, the exercise of corresponding virtues is dependent on the cardinal moral virtues of courage, temperance, justice, prudence, humanity, and truthfulness. Thirdly, they are cross-culturally universal in the sense that they all reflect the commonalities between Aristotelian and Confucian cardinal virtues, which are embedded into Western and Eastern traditions, respectively. This is important because what is virtuous may be interpreted differently in various cultures. However, the behaviors judged to be reflective of the cardinal virtues are considered virtuous across Western and Eastern cultures, or at least consistent with Eastern and Western philosophical perspectives of virtuous acts. Fourthly, they are intimately interrelated and often demonstrated simultaneously. For instance, when practicing prudence, a person will often habitually practice the other cardinal virtues such as courage, temperance, and justice. Fifthly, these virtues are contributors to *both* ethical and effective leadership. It is notable that our review of the literature covering seven value-laden leadership styles/approaches (i.e., moral, ethical, spiritual, servant, charismatic, transformational, and visionary leadership) identified 59 virtues/character traits associated with

these leadership styles/approaches, which cover all six of the cardinal virtues noted above (see Hackett and Wang 2012).

In summary, the six virtues of courage, temperance, justice, prudence, humanity, and truthfulness are cardinal, cross-culturally universal (or at least consistent with Eastern and Western philosophically based notions of virtues), interrelated, and leadership-related character traits. These “big six” virtues have potential to guide research concerning virtuous leadership in a manner analogous to the use of the “Big Five” model in the personality domain. More importantly, this much smaller, philosophically grounded and coherent set of virtues has served as the structural framework for developing the 18-item behaviorally based virtuous leadership questionnaire (VLQ).

### VLQ: A Measure of Virtuous Leadership

Using the virtue ethics literature as the theoretical base, a multi-study approach was used to develop the VLQ to assess virtuous leadership as perceived by subordinates (Wang and Hackett 2016). The VLQ is heavily behavioral in content and taps five of the six, albeit highly correlated, cardinal leader virtues of courage, temperance, justice, prudence, and humanity. For example, courage, “My supervisor acts with sustained initiative, even in the face of incurring personal risk”; temperance, “My supervisor avoids indulging his/her desires at the expense of others”; justice, “My supervisor allocates valued resources in a fair manner”; prudence, “My supervisor exercises sound reasoning in deciding on the optimal courses of action”; humanity, “My supervisor shows concerns for subordinates’ needs.” A five-point Likert-type response format (1 = Never, 5 = Always) is used to respond to all the items, with the overall score is derived by summing the scores across the five virtues.

The psychometric properties of the VLQ were established by two initial studies involving 194 MBA students at a North American university, and 230 leader and follower dyads in business organizations, respectively. The convergent validity of the VLQ was demonstrated via

Confirmatory Factor Analysis (CFA) and by positive correlations with (a) the seven-item Virtuous Leadership Scale, an overall measure of leader virtue; (b) socialized charismatic leadership; and by, (c) a negative association with Machiavellianism. Evidence of discriminant validity was reflected by (a) CFA findings indicating that the five-factor model provided a better fit to the data than a single-factor representation, and by (b) the lack of association to leader age, gender, and education. Finally, criterion-related and incremental validity was demonstrated by positive associations between the VLQ and both follower- and leader-ethical behavior, life happiness and satisfaction, as well as workplace effectiveness. More recent empirical also supports the construct validity of the VLQ (e.g., Guimarães et al. 2019; Hendriks et al. 2020; Nassif et al. 2020).

### Underlying Processes of Virtuous Leadership

To explain how virtuous leadership functions, three underlying processes are proposed, including a perception and attributional process accounting for how virtuous leadership emerges; an identity-based social-cognitive process for explaining leaders’ motivation to exercise virtuous leadership; and a modeling process to describe the interactions between virtuous leaders and their followers.

Firstly, virtuous leadership is defined as perceived from the followers’ perspective. Although a leader who possesses a cardinal virtue is disposed to demonstrate it consistently, followers may perceive their leader as virtuous to varying degrees based on their opportunity to observe and on variations in the attribution process. The extent to which followers attribute the various cardinal virtues to their leader will depend on the frequency with which followers observe: (a) the leader expressing the virtue in repeated occurrences of the same situation (high consistency), (b) the leader expressing the virtue in similar (though different) situations (low distinctiveness), and (c) other leaders who do not behave virtuously in the same situation (low consensus). The greater the number of cardinal virtues

attributed to a leader by followers, the more the leader is perceived as virtuous. Thus, some leaders might be perceived by followers as more virtuous than others. This view is consistent with that of virtues ethicists, that people do not possess a virtue by degree, and that people will display the cardinal virtues simultaneously.

Secondly, the authors argue that a leader is intrinsically motivated to exercise virtuous leadership because doing so is consistent with their virtues-centered moral identity, which is comprised of two interrelated knowledge structures: one reflecting the six cardinal virtues of courage, temperance, justice, prudence, humanity, and truthfulness held by a virtuous (moral) person, and another that characterizes how a virtuous (moral) person displays these virtues in a variety of social and organizational contexts. Specifically, a leader who practices the six cardinal virtues of courage, temperance, justice, prudence, humanity, and truthfulness consistently and habitually, will frequently activate and nourish the relevant virtues-related knowledge structures. Over time, this elevates the importance the self-accords to virtues-centered moral identity and motivates the leader to behave in a virtuous manner to maintain identity-behavior consistency.

Thirdly, it is suggested that a leader can potentially be a positive influence for followers by behaving in an observably virtuous manner. Importantly, followers are especially likely to look to a virtuous leader as role model owing to his or her positional and referent power. Thus, the modeling process associated with virtuous leadership can be described as a virtuous leader exemplifying virtuous behavior; followers observing and imitating it as it becomes perceived as increasingly congruent with their values; followers continuously practicing these behaviors because of their associated intrinsic rewards; and the behaviors becoming habitual, through practice, within the overall social context that is generally supportive of such behavior.

## Outcomes of Virtuous Leadership

As noted earlier, the authors found that virtuous leadership as assessed by the 18-item VLQ to be

associated with a range of positive leader and follower outcomes, including ethical conduct, general happiness, life satisfaction, as well as job performance. For example, it was found that follower-provided VLQ ratings positively associated with leader-rated subordinate in-role and extra-role performance, subordinate ratings of leader ethicality, as well as self-evaluations of happiness and life satisfaction among both leaders and followers. Moreover, the VLQ accounted for variance in many of these outcomes even after charismatic leadership was statistically controlled.

To date, scholars have identified several other beneficial outcomes associated with virtuous leadership as defined by the VLQ, including increases in followers' self-reported job satisfaction (Guimarães et al. 2019), followers' self-reported work-related well-being (Hendriks et al. 2020). Moreover, broader sets of outcomes, such as organizational performance (reflected by profitability, productivity, quality, customer retention, and voluntary turnover) have been implicated in relation to the Cameron (2011) view of leadership, which encompasses virtues. Virtues-based approaches to leadership have also been incorporated into contemporary management education that prepares future leaders to live an ethical life both in and outside of business (e.g., Crossan et al. 2012; Newstead et al. 2020).

## Introduction

The role of scholars in society has changed significantly over time. There have been medieval sages serving God; Copernican scientists revolutionizing worldviews; Enlightenment thinkers celebrating Reason; and Marxist radicals overturning governments. Even in present day society, scholars have many different positions and subscribe to very different ethics: They can be highly paid specialists in the medical industry; university professors pursuing basic research; critical thinkers engaged in protest movements; or employees in think tanks offering political advice.

This entry<sup>1</sup> describes how the self-understanding and ethical orientations of scholars have changed over the last century, and how individual scholars navigate ethical tensions. In doing so, it draws on organizational scholars as examples. Although the organization studies community has its own specific historical development, it shares key features not only with the social sciences at large, but also with the humanities.

First, there will be a presentation of Michael Burawoy's (2004, 2005, 2010, 2013) theory about coexisting ethical value spheres in the social sciences. Second, relying on both Michael Burawoy and James March (2007), the entry outlines four periods in the recent history of sociology and organization studies; each period featuring a predominant tension between two ethical orientations. The final part of the entry offers examples of how current individual scholars navigate ethical dilemmas in their daily work. Altogether, this serves to give a picture of the historical and individual specificities of vocational ethics among social scholars.

<sup>1</sup>Please note that this entry draws extensively on the 2017 article: Ekman (2017).

## Coexisting Value Spheres

The sociologist Michael Burawoy argues that science and scholarly work cannot be regarded as a homogenous ethical sphere. Instead, he claims that there are four different, coexisting value spheres. These four spheres have different strengths and different potential pathologies. Hence, they constitute recurring ethical dilemmas of scholarly labor, but they also serve as mutual correction, ensuring that academic endeavors do not stiffen into dogmatism. In Burawoy's view, the value spheres should be neither completely fused, nor completely separated. Instead, they should be in a continuous dialogue to keep the question of ethical values alive and debated.

Burawoy (2004, 1607) has developed a taxonomy of the value spheres, in which one axis represents two different answers to the question "knowledge for whom," namely, for academic and extra-academic audiences, respectively. The other axis represents two different answers to the question "knowledge for what," namely, for instrumental and reflexive purposes, respectively. The resulting four value spheres feature different approaches to five fundamental questions. These are: What type of knowledge is pursued; how is the quality of this knowledge legitimized; who serves to guarantee the accountability of the knowledge; what political (in a broad sense) purpose does the knowledge serve; and finally which pathology may this kind of knowledge production lead to if left unchallenged. There is not sufficient space to go over all five questions for each sphere, but a brief recapitulation follows below.

The "professional" value sphere contains instrumental knowledge produced for an academic audience. It gains legitimacy through scientific norms, and it uses scholarly peers to assess its accountability.

The "policy" sphere contains instrumental knowledge produced for an extra-academic audience. Its legitimacy stems from its concrete effectiveness, and clients or patrons assess its accountability.

The "public" sphere contains reflexive knowledge for an extra-academic audience. Its legitimacy stems from societal relevance, and it holds

itself accountable to the public by attempting to stimulate public debate.

Finally, the "critical" sphere contains reflexive knowledge produced for an academic audience. It gains legitimacy from subscribing to explicitly moral visions, and it holds itself accountable to other critical scholars.

According to Burawoy, if these four spheres do not actively challenge each other, the professional sphere risks becoming a self-referential "ivory tower." The policy sphere risks compromising scientific independence in favor of servility. The public sphere risks being dictated by societal fads in media and other popular fora. And the critical sphere risks dogmatism by regarding itself as morally superior.

Burawoy points out that the four spheres are ideal types. They have overlapping tendencies (e.g., there may be a "critical" dimension to professional values), and individual scholars may inhabit more than one sphere.

While all four spheres are always present, Burawoy argues that there is a predominant dialogue in each historical period between professional values and another set of values.

## Brief Historical Overview

Both Michael Burawoy (2004, 2005) and James March (2007) divide the history of the social sciences (or organization studies, in March's case) into four periods. One could call the first period "pre-professionalization." March only mentions it in passing, while Burawoy describes it in more detail. March then gives the three remaining periods the following headlines: "professionalization," "institutionalization and protest movements," and "neo-liberalization." March and Burawoy paint very similar pictures of these four periods, although Burawoy pays more attention to their interplay between different value spheres.

### Pre-Professionalization

According to Burawoy, the period of the social sciences from the mid-nineteenth century up until the early-twentieth century was characterized by "public" ethics that drew on religious and

vocational values. The publicly oriented scholars attempted to reform and improve society according to explicitly moral ideals. They included “crusading social reformers,” but also proponents of speculative science such as Social Darwinism (Burawoy 2005, 155). The social sciences of this period have been referred to as amateurish in that their data were often anecdotal and their methodologies unsystematic. It was precisely a disapproval of this morally infused amateurism that spurred the arrival of “professionally” oriented values in the social sciences. Consequently, a dialogue between the public and professional value spheres dominated this period. The thrust toward professionalization involved the development of explicit scientific criteria of quality, the search for universal laws, and the focus on systematic data collection.

### Professionalization

By the time of the interwar years and the mid-twentieth century, the professional values had come to dominate the social sciences. However, policy values increasingly challenged them. Both sociology and organization studies depended on large foundations such as The Carnegie, The Ford, and The Rockefeller Foundation to fund their research. Initially, these foundations played an important part in the professionalization, since they sponsored extensive reports that requested objective standards in social science education. However, by the 1960s, large parts of the sociological and organization studies research addressed mainly practical and policy problems funded not only by large foundations, but also by the State, in the form of various Ministries and Departments. In short, a dialogue between professional and policy values dominated the early- and mid- twentieth century.

### Institutionalization and Protest Movements

In the 1960s, a number of societal tensions along the lines of class, race, gender, international politics, warfare, and authoritarian education systems led to a rise in critical values. These values gained massive momentum by the widespread student revolts and the extensive demonstrations and experimentations with alternatives in the

1960–70s. Marxism became popular in the halls of Academia, and critical scholars regarded professional values as “reactionary.” In this period, the dialogue between professional and critical values dominated.

### Neo-Liberalization

From the 1980s onward, Academia went through extensive structural and ideological changes driven by neoliberal reforms. This involved increasing managerialism and performance management. It also involved larger universities with centralized administrative staffs, more students, more scholars (in increasingly precarious positions), a stronger focus on marketing, and a preoccupation with internal and external competition. According to Burawoy, this period has generated deep societal problems, including soaring inequality, climate issues, and financial crises. He expects that this will lead to a rise in public values. There are already examples of how scholars who address some of these problems publicly have risen to stellar fame, e.g., Thomas Piketty. There are also numerous scholars who write or sign public petitions requesting a stronger focus on climate questions, on the pathologies of 1% capitalism, or on the need for democratization of workplaces etc.

Although a specific dialogue between professional values and one other set of values may indeed dominate each historical period, we must not forget that all four value spheres are present in each period. As already mentioned, individual scholars rarely fit into just one value sphere, but rather navigate across them. This may give rise to dilemmas between contrasting ideals; it may serve to circumvent the tensions of dilemmas; or it may offer corrections to dogmatic approaches.

Below follows a description of four different navigation strategies observed among organizational scholars. This description is based on an interview study with organizational scholars whose career started in different historical periods (see Ekman 2017). The purpose of the study was to explore professional ethics among scholars, zooming in on both historical specificities and individual aspects such as motivations, frustrations, doubts, and hopes. The scholars appear

with pseudonyms to ensure their anonymity, since several of them are relatively prominent in the field.

## Ethical Navigation Strategies

The four different navigation strategies identified in the interview study were “selective incorporation,” “decoupling,” “antagonism,” and “double attribution.”

### Selective Incorporation

In this navigation strategy, the scholar subscribes explicitly to one value sphere, yet incorporates selected values from another value sphere.

For example, Dr. Kramer subscribed wholeheartedly to the critical sphere. He saw himself as an ideologically driven scholar with explicit moral visions of a better world. Working at a business school, he felt the need to offer active resistance against the “instrumentalism” of most business research and its subservience to neoliberal ideals. In this way, he distanced himself from the part of the policy sphere that “sold” itself to corporations or market values. However, he found other elements of the policy sphere immensely inspiring and promising. He was greatly in favor of practical interventions driven by idealism and the wish to promote moral values. As an example, he mentioned the idea of offering pro bono consulting advice to sectors that one wished to support, such as voluntary work. In other words, Dr. Kramer saw himself as a critical intellectual and as such opposed the alleged instrumentalism of the policy sphere. However, he selectively incorporated practices from the policy sphere, subsuming them under his critical orientation. One could say that he added a critical “flavor” to the policy values. In this way, he could subscribe to values from two different spheres without experiencing it as a dilemma.

### Decoupling

When scholars use the decoupling strategy, they actively subscribe to two different value spheres without reflecting on the tensions and dilemmas between them. Instead, they ignore these tensions

by subscribing to one value sphere in certain contexts, and another value sphere in other contexts, thus “decoupling” from the dilemmas.

For example, Dr. Stevens, who was formed during the professionalization period of organization studies, subscribed very strongly to professional values. He wished to pursue research whose legitimacy depended on clear scientific criteria and strict methodologies. The only way to ensure this, according to him, was to refuse conducting research driven by “use value” or “relevance.” This would compromise the basic and independent pursuit of knowledge, he argued. He expressed this in the following quote:

Well, the first sentence in most of my courses was, ‘I am not now, nor have I ever been, relevant.’ I never taught a course in which I tried to say ‘what use is this research for society or for business or for whomever?’ I just didn’t see that as my role! (Ekman 2017, 471)

Yet at the next moment, he would make the following remark:

It’s almost impossible, I think, for you to realize what the social science world was like when I started. It was a world of enormous optimism. We were going to change the world. We were going to understand the world. [...] People from different disciplines talked to one another all the time. They all belonged to committees that were going to change the world (ibid.).

So on the one hand, Dr. Stevens proclaimed that he lived and died by the dictum of not being relevant (professional values). Yet on the other hand, he announced that the primary purpose of social science was to change the world (policy values or public values). He did not reflect on the contradiction between these two positions. They simply existed side by side without disturbing each other. This allowed him to subscribe to contrasting values without experiencing them as dilemmas.

### Antagonism

When scholars use the antagonism strategy, they emphasize and consolidate the values of one sphere by defining another sphere as its enemy (see Laclau and Mouffe 1985, 125). In other words, the value sphere that they subscribe to

derives its strength from antagonizing another value sphere. They see the antagonized value sphere as embodying characteristics that are a fundamental threat to the integrity of their preferred value sphere.

Returning to Dr. Stevens above, it becomes clear that he not only relied on a decoupling between the professional (basic science) and the policy (relevance) spheres. In fact, he simultaneously relied on an antagonism between them. When he was in a context where he subscribed to the professional sphere, he consolidated professional values by actively opposing the policy sphere. Yet at other times, he would decouple from this and celebrate the policy sphere.

Another example of the antagonistic strategy was Dr. Webster. He described the professionalization period of organization studies when business schools focused on importing “real” scholars from the disciplines. This happened by explicitly antagonizing the policy sphere in the form of teachers with a business background:

We called it Management *Sciences*. So the notion was very much: It is another academic department and it has that ethos of a certain standard, and we are going to recruit people who aren't ex-business people. They are people who would otherwise be employed in an economics department, or a psychology department etcetera. (Ekman 2017, 475)

Along similar lines, he also questioned whether the MBA's practically oriented business education was in fact in line with the professional values of an academic institution:

I still struggle to see the MBA as a legitimate thing to be doing in a university . . . I don't really see it as having academic credentials . . . this sort of prescriptive stuff (ibid.).

In other words, Dr. Webster defined professional values precisely by their antagonism to the instrumental and prescriptive values of the policy sphere. The active resistance against another sphere lent legitimacy and strength to the values he subscribed to.

### Double Attribution

Like decoupling, the strategy of double attribution is an attempt to subscribe to more than one value sphere at the same time, despite their contrasting

ideals. While decoupling does this by simply ignoring the dilemmas and jumping back and forth between spheres, double attribution does this by regarding the same activities as an expression of more than one value sphere simultaneously (see Günther Teubner 1996).

For example, Dr. Carmichael claimed that he wished to pursue two types of academic values in his career: scientific quality (professional) and practical impact (policy). In his mind, these two ambitions did not rule each other out, but rather mutually supported each other. Put differently, the same academic output could serve both professional and policy values. Dr. Carmichael pursued this double agenda via a focus on “context sensitivity.” In his opinion, this ideal had relevance both in professional and policy spheres, thus allowing them to serve a double purpose. For example, a detailed empirical study of conflicts in a coal mine would offer relevance to the managers and employees of the coal mine, but it would also offer relevance to professional scholars, because it was conducted in a manner that permitted general, theoretical reflections on coal mine issues.

### The Promises and Pitfalls of Coexisting Value Spheres

As illustrated by the descriptions above, individual scholars often pursue more than one ethical agenda, looking for ways to navigate across spheres without being paralyzed by tensions and dilemmas. They can do this either by simply ignoring the dilemmas, by preferring one sphere yet complementing it with selected values from another sphere, or by claiming that they have transcended the dilemmas. It is also worth noting, that many scholars employ more than one navigation strategy in order to maximize their ethical maneuverability. For example, Dr. Stevens used both antagonism and decoupling.

According to Burawoy, the coexistence and active interplay between the different value spheres is vital for the social sciences and helps ensure their continued development and mutual correction. While this is most certainly true, the current period of neo-liberalization, increased

competition, and widespread precarization of academics may involve other dynamics. The focus on performance management has led to ever expanding targets that scholars must reach in order to ensure a career of permanent employment. Originally, these targets focused only on publications in scientific journals, i.e., on merits in the professional value sphere. But as universities become ever more dependent on rising student numbers, university management have added targets in teaching, often measured via student evaluations. Many academic employees now feel that they must “cater” to the students rather than ensure optimal professional quality. Furthermore, most universities have added a third set of targets oriented toward practical impact. This impact is measured not only by the ability to make one’s scientific results “applicable” in practice, but also by one’s public visibility in the media and on social platforms.

Put differently, neo-liberal performance management has made it mandatory for scholars to score high in at least three value spheres simultaneously, namely, the professional, the policy, and the public sphere. The question is how it affects scholarly ethics to pursue specific values for the sake of career strategy. May the instrumentality of this approach not risk destroying the ethical vibrancy of the coexistent value spheres? One could fear that they engender ethical opportunism, as scholars in pursuit of positions and promotions strategically score points in each sphere. It therefore seems pertinent that the academic community engage in a discussion with their managements about the ethical consequences of ever-increasing performance targets.

Aside from the risk of opportunism, another relevant question is whether every academic should necessarily have the same ethical profile, i.e., one that attends to at least triple value spheres. May there not be a scientific and ethical point in allowing individual variation, so that some scholars focus mainly on one sphere, while others navigate across two or more?

As this entry has shown, professional ethics among scholars vary not only historically, but also individually. Given more space, one could also have addressed variables, such as class,

culture, and geography. The entry has an ethnocentric perspective in that its narrative relates mainly to Western contexts, and in fact mostly a US setting. Furthermore, the interviews were conducted with privileged scholars in permanent positions, belonging to prestigious universities. Such scholars in these kinds of setting may have access to different navigation strategies than precarious scholars in universities that are more marginal. The story of precarious and marginal scholars would offer an interesting complement to the one depicted in this entry.

For readers interested in pursuing the subject, Michael Burawoy’s work on ethical value spheres and public intellectuals has become a separate field of academic discussion.

## Water Security: Ethical Debates

Graham Strickert and Lori Bradford  
School of Environment and Sustainability,  
University of Saskatchewan,  
Saskatoon, SK, Canada

### Synonyms

Water conflict; Water ethics; Water resource allocation; Water resources management

### Introduction

Water security has been defined as *the sustainable use and protection of water resources, safeguarding access to water functions and services for humans and the environment, and protection against water-related hazards such as flood, drought, and contamination* (Wheater and Gober 2013). Water security is a relatively new idea and as a result many people frame their understanding of water security from disciplinary perspectives or, more generally, on the basis of sustainability concepts (Cook and Bakker 2012). These include managing water resources while balancing economic, environmental, and social needs, and ensuring inter-generational equity. Conventional water resource management was focused on measuring and allocating the available

“stocks” (see ► [“Economics, Ethics, and the Environment”](#)). Allocations did not take into account the moral principles that ought to govern how people make decisions about water and how these decisions impact ecosystems, and other people dependent on that “stock” (Syme et al. 2008; Neal et al. 2014). A response to this has been a movement toward *Integrated Water Resources Management* (IWRM) which has been accepted internationally as a way for making equitable decisions with many stakeholders about their water resources, as well as anticipating and working through water conflicts. The IWRM movement, however, has not addressed the ethical dilemmas and moral imperatives that surface in the context of water security (Rahaman and Varis 2005; Gerlak et al. 2011).

In this exploration, six binate ethical dilemmas and one singular ongoing problem are presented to illustrate the trade-offs that influence decision-making in the context of water security. These dilemmas arise from the disempowerment of people in upstream areas who have negotiated legal standing which affords them rights before others. People downstream are disempowered due to the challenges in influencing upstream priorities which occasionally differ from those downstream, yet occur first in riparian location. We also discuss how the present power dynamics can affect future generations. Though simplified, the ethical dilemmas illustrate the difficulty of assigning optimized solutions to competing demands. The ethical debates between prioritizing the

(1) economy over environment, (2) economy over culture, (3) environment over economy, (4) environment over culture, (5) culture over environment, (6) culture over economy, and (7) inter-generational tyranny are described next.

## **Prudence, Temperance, Courage, and Justice in Water Security Debates**

### **Economy Over Environment: Irrigation Over Wild Fish Production**

Many of the dry places in the world have increased irrigation to enhance crop-based food production. The allocation of water outside of riparian areas means that while production of food is increased during dry periods and livelihood opportunities are increased for local people, ecosystem productivity in rivers and streams can be stressed, negatively impacting ecosystem health (Scanlon et al. 2007). The trade-offs illustrated here are about primary production of agricultural crops and the benefit of increased crop food security in areas where natural precipitation is limited or erratic; against the productivity of riverine food webs that support wildlife and ecosystems, for example, insects as food for fish, fish as food for people. The case for irrigation over fish productivity is based on economic utility; that is, “irrigation provides far more value to the economy than wild fish,” so irrigation must continue. Increasing the trade-off complexity is the notion that in temperate regions, irrigation adds only marginal value during dry periods (Rey et al. 2016); however, in semi-arid regions, irrigation can double or triple yields (Paterson Earth and Water Consulting Ltd. 2015). It is important to note, however, that the big agriculture and hydro-electric energy lobbies have been more successful at furthering their value proposition than recreational fisher-persons and environmental advocates who have often had limited voice in policy circles. The ethical debate centers on the concepts of prudence (practical wisdom), and temperance (moderation) put into place in cooperative regions, but not necessarily free market ones. Practically, the scientific and policy debate is lacking in an understanding of the precariousness

of downstream ecosystems when natural flows are altered and reduced. Utility arguments for irrigation schemes have been shown to be unsustainable over the long-term (Muhoyi and Mbonigaba 2018; Gonçalves and de Lima 2018), while unchecked irrigation and cropping has damaged ecosystems (Famiglietti 2014). Temperance is needed in the face of estimating future fortunes in irrigated crops given the unpredictability of climate and world markets. Historic records indicate that moderate growth in irrigation is a wiser choice. The question is, would you prioritize short-term crop production over long-term ecosystem health and function (see also ► “Capitalism”)?

### **Economy Over Culture: Hydropower Over Traditional Uses (Medicinal Plant Collection, Hunting, Trapping, and Fishing)**

Hydropower is a relatively cheap form of electricity, though it is not environmentally benign. Many countries are shifting to hydropower generation to shift away from coal-powered electricity generation. Hydropower production, however, has three main environmental harmful effects including (1) reversing seasonal flows regime, (2) reducing the peaks of high flows, thus limiting the flushing of riparian areas and (3) altering the sedimentary processes of rivers (Sokka et al. 2016). For cultures and communities which practice traditional land uses such as gathering medicinal plants, hunting, fishing, and trapping in riverine ecosystems, hydropower development has been damaging, but since hydropower produces tremendous economic value, it persists despite community opposition. Hydropower production as a practice has overshadowed some cultural values, and groups expressing fervent opposition and fears of culture lose ongoing battles against hydropower development. The ethical debate here centers on justice (undertaking what is good for the community). Hydropower provides a service, but, it is at the cost of environmental health and balance in many cases, while traditional uses act in balance and have evolved to provide stewardship of the environment. The question is, would you prioritize the energy needs of the masses over

livelihoods dating back millennia that are practiced by traditional cultures?

### **Environment Over Economy: Protected Species Over Expanded Irrigation**

In countries where threatened species are protected by law, irrigation is occasionally stopped when the river systems fall to predetermined thresholds to protect environmental flows. Australia's Murray-Darling, Canada's South Saskatchewan River, and the USA's Colorado River are examples of rivers where drought conditions led to the halting of irrigation rights to protect threatened species of fish among other ecosystem services. Rare species of fish, plants, wildlife, and other genera were prioritized over economic gains, and few would argue that the decisions took courage; yet, questions about the prudence of those decisions arise. Some posit that the existence value of a species, for example, the humpback chub or Colorado pikeminnow, which provides little direct economic gain to the human system, is of higher practical value than irrigation of crops (Osmundson and White 2014). The question here is, would you prioritize a rare species' right to exist over agricultural productivity?

### **Environment Over Culture: Protected Species Over Traditional Practices**

In British Columbia, Canada, there is a serious decline in wild sockeye salmon populations. Recreational, commercial, and even First Nations food and ceremonial harvesting of sockeye salmon was closed in 2017 and will be closed until there is an increase in sockeye abundance. Sockeye are a key element of the coastal Pacific Ocean, coastal stream, and west coast rainforest ecosystems as they are a key nutrient source. Sockeye salmon runs attract tourists to B.C.'s rivers. Sockeye salmon is an important food source and sacred ceremonial animal in some Indigenous cultures along the west coast. The numbers of sockeye salmon are at an historic low, which led to a provincially driven embargo on recreational fisheries (Viatori 2016). As a result of the threat to this sacred species, local Indigenous communities imposed their own embargo for

their own people. This was done despite the fact their indigenous rights meant they could still fish regardless of provincial limits. The ethical debate here centers on temperance; the ability to exhibit self-control by the Indigenous groups who have temporarily suspended sacred practices for environmental restoration. The question here is, would you be able to prioritize environmental health via species recovery efforts, over the need for expression of your sacred practices?

### **Culture Over Environment: Agricultural Run-Off Over Threats to Environmental Health**

In the Canadian Prairie provinces, cattle wintering sites such as corrals and fenced areas are used to overcome challenges of harsh weather. Adequate shelter and bedding are provided for the animals, and feed efficiency can be enhanced. Riparian areas provide shelter and water and have long been the site of choice for ranchers for wintering, whose herds have grown tenfold from early settler times. Managing the manure and run-off are important for cattle producers particularly in calving areas. Cattle producers have practiced good hygiene on wintering and associated calving sites by taking advantage of the proximal water sources in riparian zones to remove waste and improve conditions for herds. Preliminary estimates by the Saskatchewan Agriculture, Food and Rural Revitalization, and the Saskatchewan Watershed Authorities suggest that as many as 10,000 producers winter cattle along watercourses in Saskatchewan. Manure flushing through waterways contributes to eutrophication and creates risks for downstream environments and people through exposure to pathogenic bacteria, viruses, protozoa, and parasites in surface waters, and leaching into groundwater. This trade-off centers on the prudence and practicality of the winter cattle corral practice for ranchers versus the justice for downstream communities who suffer from the exposure and reduced water quality. The question here is, would you consider imposing restrictions on wintering cattle near streams to reduce the potential effects from run-off (i.e., diffuse source nutrient loading)? (see also ► [“Environmental Ethics and Sustainability”](#)).

### Culture Over Economy: Assigning Rights of Personhood to Rivers Over Economic Gain

In recent years, there have been some instances where the cultural importance of water has been prioritized over the concept of water as an economic good. In Maori culture, mountains, rivers, and some landmarks are believed to be the ancestors of particular tribes, and water is a *taonga* (sacred treasure). Water features such as rivers and springs play central roles in origin stories and are considered valuable living cosmological elements. For instance, in New Zealand's North Island, the sacred Whanaganui River was given legal rights as a person in an effort to protect it from harm from hydropower development and water bottling companies. "I am a river and the river is me" is an important concept within local Maori Iwi's *tikanga* (lore). The river exists, just as a person does, and hence, deserves the same rights including the protection from physical harm (Hutchison 2014). The ethics of this debate focus on courage and justice. It was courageous of New Zealand law makers to make the morally significant and unprecedented decision to assign personhood to the river. It was an act of justice to make the decision that is good for the Maori and communities of environmentalists (e.g., ENGOs) dwelling along the river and further afield. The question here is, would you be able to prioritize cultural beliefs such as *taonga*, over water-based economic gains? (see also ► ["Aboriginal Ethics: Traditional and Contemporary"](#)).

### Intergenerational Tyranny: Inland Freshwater Deltas

One of the most troubling ethical dilemmas in the context of water security is how to include consideration for future generations in water management decisions today. For example, damming of rivers in central Canada for irrigation, flood protection, industrial growth, and hydropower development (i.e., the Saskatchewan, Peace-Athabasca, and Slave River Watersheds) has affected water quantity and quality, and altered natural rhythms over the last half-century. As a result, the children of traditional harvesters can no longer continue their families' long-standing vocations, and the quantity and timing of water coursing through

the watersheds is irreversibly altered. Species once rich in deltas are disappearing, and delta socioecological systems and knowledge are in decline (Prowse and Conly 2000; Mantyka-Pringle et al. 2017). We have learned that water management decisions of the past have negatively affected the abilities of current generations to enjoy the same water quality and quantity as before (Boelens et al. 2012; von der Porten and de Loë 2014). The limited ability we have in predicting water needs and availability in the future hamper our efforts in ensuring that today's decisions are prudent, tempered, courageous, and just. The question here is, would you make a water management decision without adequate or accurate information about the potential impacts on, and needs of, future generations?

### Summary and Looking Ahead

These dilemmas have been simplified and only serve as examples from which to bring attention to a few moral and ethical aspects of water security. Ethical dilemmas take time and energy for us as individuals and groups to reach a decision, if we can at all. Usually multiple ethical dilemmas occur simultaneously for any water decision scenario, and decisions are made by groups, who come to the table with differing values, attitudes, intentions, and powers. The pressure to shift to thinking about the ethics of water security has both enabled and repelled alliances that could transform the current "elite water orders" including Israel in the Jordan River Basin and Egypt in the Nile River Basin. While IWRM works to allow multiple voices in water management decisions, and thereby purports to overcome inequity in water security negotiations, its continuing focus on "water resources" constrains discussion to the absence of ethical dilemmas. Navigating ethical dilemmas, therefore, requires that good water governance processes are in place. Such processes must be accessible (i.e., inclusive of a wide variety of viewpoints), responsive (i.e., each viewpoint is heard and responded to by the others), and explicitly describe trade-offs including: prudence, temperance, courage, and justice. Water security as a

concept will not be complete without transparent and pluralistic water governance processes that lead to no-regret decisions.

## Wealth Equity

Samuel M. Natale and Anthony F. Libertella  
Robert. B. Willumstad School of Business,  
Adelphi University, New York, NY, USA

## Synonyms

Economic justice; Economic opportunity; Wealth disparity

## Description

Wealth equity is defined as the measurement of financial and economic well-being among and between groups and countries as well as individuals. It is the measurement of the wealth gap between the “haves” and the “have nots.”

## Wealth Equity

The classic study by Williams (1976) delineates wealth as tied to well-being in personal and societal venues. Wealth is used as reference to one's control of material goods and currency, which subsequently creates a feeling of complete contentment. The Oxford English dictionary defines the term equity as “the quality of being fair and impartial,” whereby individuals are treated as equals in a just and equitable manner (Equity n.d.). There are references to equity in relation to the call for equal rights and status as far back as the age of exploration (Williams 1976). In contemporary terms, the word “equity” seems to be associated directly with a mode of existence and as an initial point of departure, not a state in itself.

Equity became immediately associated with “education” as a means of access to wealth. Initially, education was tied to the family process of the incorporation of children into the family union, but the concept “jumped” to cover the various ways in which one placed themselves in position to get access to the wealth in an equitable way.

The dynamic between “wealth” and “equity,” when used together, reflects the notion that there are de facto individual assets to which one can gain access traditionally through the education system. This is complicated when it is recognized that heredity can also endow one with wealth transcending the “level playing field” of moral neutrality. So it becomes transparent that there is no one way to wealth acquisition.

Natale and Libertella (2017) assert that, in order to assure a level playing field, further analytics are necessary and they involve the following principles: The assumption that “Human Dignity is Pre-eminent; The Common Good as

Normative; Subsidiarity; Government Obligations; Rights; Empathy and; Training the Will’.”

Once the basic assumptions, values, attitudes, and needs have been designated, one is positioned to address the issue of wealth equity in a more holistic framework.

In a broader context, “wealth equity” is more than simple possessions or land but in the moral sense of the “rights” of an individual to secure their place in an economy that assures personal growth and freedom to achieve self-determination. It is this logical link that can exert some control over poverty. Any effective analysis of “wealth equity” requires correlative components be introduced such as “justice,” and it is necessary for justice to “flow down” through various portals to provide a bulwark for the level playing field required in morality.

The “royal road” to wealth equity has been conjoined with education. As such, education creates a condition sine qua non for individuation and access to ownership of property and a participation in the commonwealth. It is axiomatic that as education increases, economic parity is at least more possible (Van de Werfhorst and Shavit 2015). Stewart (1999) maintains that education is the “foundation for creating intellectual capital which, in turn, produces wealth.” Bloom (2006) asserts that, on the global front, the value placed on education as an instrument for enhancing economic parity is reflected by the substantial monetary investments made by national governments.

Nevertheless, there are confounding variables where individuals who have attained higher education do not attain the necessary equity. These confounding variables include “military conflict, economic mismanagement, macro-economic failure, poverty, power, freedom, social status, immigration, emigration, and the lack of political will, which may hinder ascertaining any direct cause and effect relationship between education and wealth equity” (Driscoll 2017).

The goal of education for wealth equity has been discussed at length by UNESCO (2015), and their work focuses on the four key “pillars of learning,” “to know, to do, to live together, and to be.” Concomitantly, higher education postures individuals to independently and collectively

approach the wealth equity they seek; No other variable is so tightly bound to success in achieving even modest equity.

Wealth equity transcends multiple categories and extends into correlative issues such as gender and race.

One of the driving forces behind wealth equity is the attainment of gender parity through gender equitable reforms. Gender equity is defined as the “fairness of treatment for women and men. . . considered equivalent in terms of rights, benefits, obligations and opportunities” (International Labour Office [ILO] 2000).

Research has found that reducing the gender gap can have positive effects, not only on a social level, but also on an economic one (Noland et al. 2016). There has been a significant push for the development and implementation of policies that promote gender parity and a veritable call-to-arms to close the gender equity gap, which, in turn, will benefit the wealth equity dynamic. In recent years, efforts to promote gender parity have been undertaking by both developed and developing countries.

The concept of “Gender Mainstreaming” was introduced by the United Nations (1997), whereby the goal is to promote a method of policy-shaping that takes into perspective the goal of gender equality when generating policies and provisions at all phases of development (Council of Europe 1998). This concept was quickly adopted by the European Union and has since been implemented by several nations (Verloo 2005). Much work remains to be done, however; experts predict that the global gender gap will not be fully closed until 2186 (Chiang 2016).

Race remains a category of considerable concern with regards to wealth equity worldwide. Race is believed to be a strong predictor of one’s economic mobility; this is, due, largely in part, to long-standing procedures and systems that produce race-specific wealth disparities (Wolff et al. 2017).

Globally, there have been ongoing attempts to address racial inequality as it relates to wealth equity. Countries including the United States, Japan, China, India, and South Africa have made attempts to address the wealth equity issue in its

varying contexts (Lehohla and Shabalala 2014; Pe 2016); these efforts are ongoing.

Shifting demographics, the ease of geographic mobility, and economic integration has sparked a renewed urgency toward addressing wealth equity and race worldwide.

Understanding the dynamics of wealth equity is fundamental in the global development of fair and just societal norms, as equal access to wealth can allow individuals to uniformly access and benefit from all the world has to offer.

## Max Weber

Together with Karl Marx and Emile Durkheim, Max Weber (1864–1920) is considered to be a foundational figure in sociology. His interpretive (i.e., *Verstehen*) sociology is one of the cornerstones of sociological theorizing and a precursor of different streams of microsociology focusing on social action and social agency. The nature of

Weber's *Verstehen* sociology is shaped by two important intellectual trends: (1) the German Historical School's methodological debate regarding the crisis in the legitimacy of historical sciences and (2) Weber's dialogue with Marx(ism).

## The Methodological Debate

Set against the late nineteenth-century growth of the natural sciences and the preeminence of their methodological and investigative authority, the German Historical School's methodological debate aimed to respond to the critique which cast philosophical and historical sciences as intuitive, speculative, and therefore nonscientific. The critique was premised on the argument that positivism provides the only viable epistemological and methodological foundation for a genuine scientific investigation and analysis, and therefore *the* criterion for differentiating science from non-science. Accordingly, everything that does not follow the positivist scientific model is to be rejected as nonscience.

The response to this critique was an argument that – because of their different objects of inquiry – natural and social sciences are two distinct types of scientific enterprise, and that the epistemological and methodological criteria of natural sciences are not transferrable as the standards for evaluating the scientific nature of historical and social sciences. From this viewpoint, the scientific nature of historical and social sciences ought to be judged by how accurately they address their own *problématique* rather than how well they replicate the methodology of the natural sciences in the investigation of their own objects of analysis.

The position of the German Historical School was that historical and social sciences are focused on the investigation of the “ethical realm,” i.e., the realm of values and norms that underlie social action and motivate human behavior. As such, their aim is to understand something that is both subjective and historically specific. In contrast, the focus of natural sciences is the “empirical realm,” i.e., the realm of laws and regularities that underlie the working of the natural world. Thus, rather than being focused on investigating

what is particular and unique, natural sciences aim to explain what is general and universal. Given this, the divergent epistemological and methodological foundations of natural and social sciences ought to be taken as both appropriate and indispensable.

Max Weber shared the German Historical School's view that the aim of historical and social sciences is to understand the particulars of historical and ethical motivations of social action, which is something that cannot be grasped empirically, through observation, but only theoretically, through meaningful interpretation. He therefore considered historical and social sciences – and sociology, in particular – to be the sciences of values grounded in epistemological and methodological postpositivism, and aimed at providing an interpretive understanding of the normative elements of social action.

### Weber's Dialogue with Marx(ism)

Irving Zeitlin (2001: 197) characterizes Weber's sociology as “a dialogue with Marx's ghost,” centered on three key issues: the nature and purpose of social theory; the understanding of history and social development; and the Marxist model of society. Regarding the first one, Weber was critical of the Marxist position that social theory and social sciences ought to be understood and used as intellectual tools for social critique, oriented towards transformative change. In contrast, he argued that the key objective of social theory and social sciences ought to be a disinterested pursuit of historical facts about society, and a search for valid historical truths. In Weber's view, casting the scientific pursuit of knowledge in explicitly normative and/or ideological terms of any kind equals abandoning science for politics. To be meaningful, science needs to be value-free.

Weber was also critical of the Marxist stance that, ‘in the final analysis,’ economic forces are the driving engine of history and societal transformations, and that the analysis of society's economic foundation therefore provides the ‘master key’ for understanding the dynamics of all aspects of social life. In Weber's view, this kind of ‘economic reductionism’ fails to accord sufficient

attention to noneconomic forces in the analysis of social life, and thus provides a partial understanding of the historical mechanisms and forces driving social change and transformations. Accordingly, an appropriate analysis of society ought to be based on taking into account both economic and noneconomic factors rather than giving an *a priori* analytical significance to one of them.

Finally, in contrast to the Marxist base-superstructure model of society which prioritized economy as society's real foundation and therefore the force shaping all noneconomic aspects of social life, Weber argued that society is a network of four interrelated and equally important social spheres: economy, politics, law, and religion. While not denying the importance of the economy, Weber disagreed with the Marxist proposition that society's political and sociocultural life is, in the final analysis, a ‘superstructural reflex’ to the nature of society's economic base. His position was that the centrality of the economy in the overall development and life of society should not be assumed *a priori* but established only through an analysis of empirical realities at a given point in time. Thus, Weber advocated a nondeterministic model and analysis of society, premised on the propositions that, at different points in time, (a confluence of) any of the four social spheres may have a predominant impact on shaping the overall course and dynamics of social life.

### Verstehen Sociology and Social Action

According to Weber (in Heydebrand 1994: 228), “sociology . . . is a science which attempts the *interpretive understanding of social action* in order thereby to arrive at a causal explanation of its courses and effects.” Thus, the key point of sociological analysis is to understand, through interpretation, the underlying motivations, nature, and consequences of social action in relation to particular social setting(s) that shape these. Weber defines social action as subjectively meaningful (i.e., intentional) behavior mindful of the behavior of others, and performed accordingly. As such, social action can be interpreted – i.e., made sense of – rationally (*via* logic and reason)

and/or empathically (*via* identification with its emotional content), and understood – i.e., known – through direct observation that explains the actual content(s) of social action and/or explanatory understanding that explains the actual motivation(s) for social action.

For Weber, there are four general types of social action: traditional (i.e., behavior animated by tradition as a set of external regulatory rules); affective (i.e., behavior animated by an emotional state in given circumstances); value rational (i.e., behavior based in a binding moral code); and instrumentally rational (i.e., behavior animated by rational means-ends considerations motivated by the most efficient attainment of goals). Methodologically, the four types of social action are what Weber (in Shils and Finch 1949: 90) refers to as the ideal types, “formed by the one-sided accentuation of one or more points of view and by the synthesis of a great many diffuse, discrete, more or less present and occasionally absent concrete individual phenomena, which are arranged according to those one sidedly emphasized viewpoints into a unified analytical construct.” As such, rather than being the faithful reproductions of concrete reality, the ideal types are accentuated typifications of courses of conduct used as the methodological devices for gauging similarities and deviations in concrete cases.

For Weber, instrumentally rational social action is an ideal type that corresponds most closely to courses of conduct in the West. It is reflective of the broader processes of rationalization that led to the rise of modern Western society and its particular kinds of economic, political, legal, and religious spheres. In Weber’s view, the hallmarks of modern Western society are submission of social life to planning, rational action, and technical procedure; reliance of calculation and technical knowledge in order to obtain control over the natural and social world; and understanding of the world based on practical rather than metaphysical thinking. All of these are grounded in a particular kind of systematic reasoning – i.e., instrumental rationality – centered on the means-ends calculation, and aimed at efficiency maximization. According to Weber, the historical roots of rationalization and instrumental rationality can be traced back to a specific form of

Protestant ethic, first emerging in the sixteenth-century Western Europe.

## Class, Status, and Party

While acknowledging the importance of economy and social class in generating and reproducing social inequalities, Weber took issues with the Marxist proposition that, in the final analysis, all social inequalities are social class-based and economic in origin, and argued for a broader and more nuanced understanding centered on social class, status group, and political party. For Weber, social inequality is rooted in competitive strategies aimed at monopolizing economic wealth, cultural prestige and political power, and centered on the membership to social class, status group, and political party as the strategic means towards creating advantages in monopolizing these key societal resources. The nature of social inequality is thus multidimensional and its roots multicausal and, therefore, irreducible to society’s economic realities alone.

In Weber’s view, social class is an economic category in the sense of being tied to competitive strategies centered on the struggles over economic wealth. Its nature, however, is rather complex and cannot be reduced to the Marxist bourgeoisie/proletariat social class-dichotomy grounded in the ownership-of-the-means-of-production criteria. For Weber, social class can be understood and defined in three different ways: (1) in relation to one’s market situation based in property ownership and/or one’s skillset; (2) in relation to different types of social action based on class interests; and (3) in relation to historical types of social struggle. The first understanding leads to a definition of social class as a social group distinguished by ‘life chances,’ where life chances depend on how marketable one’s property and one’s skills are, and how well they can be exchanged on the economic market. In contrast, the second understanding of social class leads to its definition as a group in similar economic circumstances and with similar interests, and, therefore, with alike motivations and inclinations to pursue a specific type of social action. Finally, the third understanding leads to a definition of social class as a group with unique class interests, engaged in a

distinct type of collective action aimed at discernible and immediate economic opponent jeopardizing the pursuit of life chances. In Weber's view, therefore, the reality of social class is much more complex compared to how Marxists define and understand it: there are multiple – rather than only two – social classes in society, and an individual can simultaneously belong to more than one social class.

As a cultural category, status group refers to a group of individuals accorded or denied honor and prestige on the basis of shared lifestyle, habits of taste, and consumption. As such, it is a means of monopolizing cultural resources by way of social distinction valued in society. According to Weber, status groups can be distinguished on the basis of three characteristics: (1) the degree of social esteem and amount of honor accorded, (2) social segregation, and (3) monopolization of status privileges. What therefore differentiates one status group from another is the extent to which its members can, through specific patterns of consumption and taste patterns, project a particular lifestyle to society, use it to set themselves apart and form a 'closed circle' with distinct rules, regulations, and social sanctions, and – on the basis of social esteem and honor associated with their lifestyle – claim special material and immaterial entitlements. For Weber, a common feature of all status groups is that they form communities of shared interests and purposes, aimed at monopolizing distinction-based cultural prestige.

Political party refers to a group of individuals whose aim is to acquire political power and influence actions of others for political purposes and gains. According to Weber, all political parties are based on voluntary membership and adherence to the rules of the group within the party. Their success rests on the ability to persuade others to adhere to a specific political vision and principles, and establish political authority through a particular type of political domination.

### **Political Authority: Influence, Power, and Domination**

According to Weber, political authority can be exercised by way of influence, power, and domination. Influence is the most elementary principle

of exercising political authority: it is centered on the ability to have impact on others through suggestion or persuasion in order to elicit compliance. In contrast, exercising political authority by way of power rests on the ability to carry out one's will despite opposition or resistance. For Weber, the principal weakness of power as the principle of exercising political authority and eliciting compliance is the lack of psychological identification with the system of political rule – i.e., the fact that political compliance is not a matter of believing in, or identifying with, political authority but is grounded in the fear of punitive action in the absence of demonstrable obedience. Domination is defined as the legitimate exercise of political power, grounded in the right of the ruler to issue commands to others and expect them to obey without opposition or resistance. What makes the exercise of political authority through domination legitimate, thus, is the validation of the ruler and the apparatus of authority through psychological identification with prevailing political norms and values. According to Weber, domination-based compliance is not elicited through the fear of punitive action in the absence of demonstrable obedience but through the psychological commitment to what is internalized as the right and just political authority.

Weber identifies three types, or systems, of domination: charismatic, traditional, and legal-rational. Each varies in terms of four key characteristics: form of legitimacy; type of obedience; administrative apparatus; and a mode of exercising power. Political authority based on charismatic domination rests on the perceived extraordinary qualities and powers projected by a charismatic leader, often interpreted as divine in origin and recognized by followers as valid and true. Its legitimacy stems from the strong psychological connection to the leader and is grounded in personal inspiration and inner devotion. Charismatic domination often emerges in times of societal crisis and presents itself as a revolutionary force for change through a 'renunciation of the past' and a 'promise of a better future.' Consequently, a failure to deliver on the promise often results in the loss of legitimacy. Charismatic domination is administered through a select group of

disciples and followers, with decision-making done by the leader.

Political authority based on traditional domination rests on the sanctity of age-old rules and powers, which define a framework of obligations that binds individuals and political leaders into a master/subject relationship through the subject's personal loyalties to the ruler. Leadership powers are thus considered as legitimate in the context of specific traditional rights and norms, and exercised by those who establish themselves as their embodiment. Traditional domination is implemented through 'edicts' (i.e., personal decrees issued by a leader) and administered through the enforcement of inherited right.

Political authority based on legal-rational domination rests on the belief in the legality of enacted rules, and the right of those in a position of authority to issue commands. The source of its legitimacy, therefore, is obedience to an impersonal legal order of rationally determined judicial rules and 'statutes' (i.e., formal regulations) rather than to personal authority of a political leader. The legal-rational domination is exercised through the universal application of judicial rules to all members of society (i.e., the rule of law), including those in a position of political authority, and administered through a bureaucratic network of functionaries with specific skills and competencies. According to Weber, the key features of bureaucracy are: (1) organizational hierarchy; (2) administration through office, based on functional separation of tasks and distinction between private and official duties and affairs; (3) decision-making based on technical and expert knowledge and strict observance of legal rules; (4) a system of formal rules governing actions and behaviors of bureaucratic administrators; (5) impersonal authority based on formal rationality (i.e., decision-making subject to means-ends calculation, and problem-solving based in a straightforward application of technical criteria); and (6) administration through written documentation and file keeping.

### Capitalism and the "Iron Cage" of Rationality

One of the major themes of Weber's sociology is the historical development of modern Western

capitalism through the rationalization of its economic, political, legal, and religious spheres. For Weber (1958: 17), "capitalism is identical with the pursuit of profit, and forever *renewed* profit, by means of rational capitalistic enterprise." The latter refers to the absence of irrational limitations to trading and profit making through the rationalization of commercial activities, techniques and interchanges, coupled with the rise of a universal set of standardized commercial techniques for rendering balance (i.e., rational accounting). According to Weber, the development of 'rational capitalistic enterprise' is accompanied by (1) the formation of the rational state as a political institution based in formal law and political administrative expertise; (2) the rise of the rational legal regulation based in formal application of impersonal norms and sanctions; and (3) the emergence of an ethical system based on the 'spirit of profit,' governing social and economic activity. Together, these constitute the bedrock of the uniquely Western capitalist society.

For Weber, the historical roots of all-pervasive rationalization of Western society can be traced back to the sixteenth-century Protestant Reformation spearheaded by Martin Luther. Its end sociocultural effect was the rise of Protestant doctrine of asceticism as a set of ethical principles centered on self-control, continuous work, and self-denial, which informed all aspects of one's daily conduct. Over time, these evolved into the general spirit of capitalism as the cultural foundation of all spheres of modern Western society, resulting in the submission of social life to planning, rational action, and technical procedure for the purpose of consistent outcomes and efficiently attained goals. This, in turn, led to the rise and entrenchment of bureaucratic principles and practices as the organizational, institutional, and administrative bases of thus rationalized social life.

According to Weber, the rationalization and bureaucratization of Western capitalist society indicates the triumph of formal rationality over substantive rationality. The consequence thereof is the shift from decision-making grounded in a criterion of ultimate values and an appeal to ethical norms, towards decision-making centered on means-ends calculation and formal application of technical criteria. Although unintended, the

ultimate long-term societal effect of this shift is a disenchanted world trapped the ‘iron cage’ of rationality – i.e., a thoroughly modernized, secularized, routinized, and intellectualized Western society encased in the dehumanized systems of rationality, efficiency, and control. As Weber (in Gerth and Wright Mills 1958: 155) writes: “The fate of our times is characterized by rationalization and intellectualization and, above all, by the ‘disenchantment of the world.’ Precisely the ultimate and most sublime values have retreated from public life either into the transcendental realm of mystic life or into the brotherliness of direct and personal human relations.”

Contrary to Marxists, who believed that ending capitalism through revolution would set the stage for a more humane and egalitarian world, Weber was skeptical about the prospects of re-enchanting the world and dismantling the iron cage of rationality. In his view, a revolution to end capitalism would lead to a change in form but not necessarily in substance, and would likely result in one type of rationalized and bureaucratized society being replaced by another.

Efficiency; Ethics (virtue, Kantian, liberalism, rights theory, consequential vs. process, utilitarian); Fairness; Liking vs. wanting/desiring; Neo-classical choice theory; Pareto improvements; Well-being (emotional, life-satisfaction, and societal)

## Introduction

*Welfare economics* is an ethic (a method for determining whether an action, behavior, or policy is *right* or *wrong*). Many economists endorse it to determine right from wrong: whether an action is *ethical/moral* vs. *unethical/immoral*. Those that increase societal well-being are (ethically) right and those that decrease it are wrong, and those that increase it more are ethically preferred to those that increase it less.

“Welfare economics is an atypical form of *welfare consequentialism*, *WC*: consequentialist in that whether an act or policy is right or wrong is a function of only its consequences—the [adjective] welfare because the only consequences that matter are the welfare (well-faring) consequences. [But] most welfare consequentialists do not adhere to a welfare-economic ethic. And most moral philosophers are not welfare consequentialists—neither are most normal folk” (Morey 2018).

Consequentialist ethics can be based on consequences other than societal well-being (Sinnott-Armstrong 2019). For example, one could be a “value” consequentialist where value is something different than societal well-being. Peter

Singer (1997, 2011), the modern face of utilitarianism, is a consequentialist who argues that the consequence that matters is the extent to which wants and desires are fulfilled. Opposite to consequentialists are *processists*: ethicists who judge solely on whether the process that caused it is a right or wrong process (e.g., majority voting, good or bad intentions). For them, consequences are ethically immaterial. Organizing:

- Welfare economics is an ethic.
- Defining individual welfare (well-faring) and societal welfare.
- Whose well-being, *WB*, counts? And what is *societal WB*?
- Liking vs. wanting/desiring.
- Is an individual's level of WB cardinally meaningful, or only an ordinal concept? And the implications for mapping from the WBs of members to societal WB.
- Implications of the welfare-economic ethic.
- Most ethicists (moral philosophers) reject the welfare-economic ethic, so do normal folk.
- Welfare economics is not a form of utilitarianism.
- Modern economic philosophers who reject the welfare-economic ethic include:  
John Rawls (1921–2002), Amartya Sen (1933–), and Partha Dasgupta (1942–).

Important issues and complications not discussed:-

- How to estimate an individual's WB and a change in its level.
- Welfare economics in a world of risk and uncertainty.
- Things are more complicated if people care about their relative position (improving your position in society increases your WB but decreases the WB of others).

What follows is written by a hesitant welfare economist: disciples of welfare economics will find it too negative, critics too positive. Increasing societal WB is appealing (more so if expressed as reducing ill-being/suffering), but welfare economics provides limited guidance when one is

trying to determine whether a particular action increases societal WB. Many ethics disappoint when it comes to determining whether a real-world action is right or wrong.

Also, and troubling, welfare economics can find policies and actions that many would find abhorrent, the right thing to do.

For readers who want more details and further readings, see the cited Stanford Encyclopedia of Philosophy (*SEP*), review articles, and the cross-references to entries in this volume.

## Welfare Economics

### Welfare Economics Is an Ethic

Whether it is, of course, depends on how one defines the term. For John Stuart Mill, an ethical system is simply “a method to test right from wrong.” Quoting from the *Journal of Economic Literature* article *Taking Ethics Seriously*, Hausman and McPherson (1993)

Welfare economists have sometimes thought that their techniques are virtually morally neutral because they rest on innocuous and uncontroversial moral premises such as the Pareto principle. But the standard definition of a social optimum compares social alternatives exclusively in terms of the goodness of their outcomes (rather than the rightness of their procedures) and identifies the goodness of outcomes with the satisfaction of individual preferences. These commitments to value only outcomes and to measure outcomes only in terms of individual utilities are neither neutral nor uncontroversial (see Sen 1979, and Sen and Williams 1982).

### Quoting from Morey (2018)

That Pareto improvements are always improvements, while obvious to welfare economists, is rejected by, and inconsistent with, most other ethical criteria, such as virtue ethics, Kantian and other duty-based ethics, ethics based on religion (sins are wrong, no matter how they affect well-being, WB), rights theory, and ethics that judge acts moral or immoral based fully, or in part, on process and intent. [A change is a Pareto Improvement if after the change some members of society experience more WB and no members experience less.] John Rawls (1971) rejected it, arguing that increasing the WB of the better-off at no cost to the worst-off is not right. An objective inconsistent with most moral objectives is a moral objective.

“A moral principle can be viewed as a requirement to exclude the use of certain types of information in making moral judgements” Sen and Williams 1982. . . welfare economics excludes from moral consideration the specifics of the act, its cause, and the intent. It also excludes from moral consideration how a policy or act affects individuals who are not members of society.

(Adam Smith was a virtue ethicist (McCloskey 2008) who suggested two guides for behavior: rules against really bad acts (killing, raping) and virtue for everything else. The morality of an act depends on both intent and consequence. If the intent was virtuous, the behavior is right, unless, of course, the outcome is disastrous. Virtue (“proper gratitude, kindness, courage, patience, and endurance”) results from empathy for others – our “moral sentiments”. Smith was not a welfare economist).

### Defining Individual Welfare (Well-Faring)

Define an increase in an individual’s welfare as an increase in their WB, a decrease with an increase in their ill-being. WB falls into three categories: emotional WB, life-satisfaction WB, and pleasant and unpleasant sensations (Kahneman and Deaton 2010, Morey 2021). Welfare economics assumes that every type of WB is *commensurable* (the

individual can rank all combinations of WB types and levels in terms of (overall) WB. [Most moral philosophers, starting with Aristotle, reject complete WB-commensurability, arguing, for example, that the types of WB generated by friendships and religious beliefs are not commensurable with the pleasures produced by ice cream (Nussbaum 2012).]

Complete commensurability of WB types and levels implies that the individual has a complete WB ranking of bundles all experiences are WB-comparable, a critical assumption of *Neo-classical choice theory*: the theory of behavior economists teach to undergraduates. (*Bundle  $j$ ,  $j = 1, \dots, J$ , is a package of experiences. For example, in *Bundle 23* the individual might be a plumber in Pittsburg, eat a lot of pizza, have two kids but few friends, and have a beautiful garden. Her life with *Bundle 121* would be different): Imagine an individual named Fred, Fig. 1, who experiences only three types of WB: the WB produced by the consumption of goods and services ( $WB_g$ ), the WB produced by having friends, family, and a partner ( $WB_f$ ), and the WB produced by having legal rights and freedoms ( $WB_r$ ).*

### Welfare Economics,

**Fig. 1** Four of Fred’s feasible packages of WB

The green/rectangle package of WB-types produces more (overall) WB for Fred than the black triangle package because it produces more of all three types of WB – so Fred ranks it higher in terms of WB. For the same reason, the green/rectangle package is ranked higher than the red/star package of WB-types. In none of the other pairs, does one package dominant. For example, the red/star package has more  $WB_f$  and  $WB_g$  than the black package, but less  $WB_r$ . Complete WB-commensurability means Fred can make all of the comparisons: he can, for example, rank the red/star and black/triangle packages of WB-types. By assumption, Fred has a complete WB-ordering of these four packages and all other feasible packages of WB-types. If he could not compare more  $WB_f$  with  $WB_g$ , this would not be the case.

While complete WB-commensurability and welfare economics are often simultaneously assumed, one can adopt both, either, or neither.

### Whose WB Counts? And What Is Societal WB?

*Societal welfare (societal WB)* depends only on the WB of society's members – nothing else

affects it. A *State-of-the-World, SOW*, identifies what every individual experiences in that state: everyone's bundle. Each member of society associates some level of WB with each SOW. Societal WB is identified by assuming the WB each member associates with each conceivable SOW maps into an ordering of all conceivable SOW in terms of societal WB – by construction, higher-ranked states are associated with more societal WB.

Imagine a world of three individuals: Fred, Wilma, and Barney. The problem is how to take different combinations of each of their WB and map them into an ordering of societal WB. For simplicity of exposition, Fig. 2 is drawn so that it is almost identical to Fig. 1 in appearance but what is on each axis is now different: the vertical axis is now Fred's WB, the right axis is Wilma's WB, and the left is Barney's WB, so each dot (combination) represents a different combination of their WB's.

Welfare economists universally assume a new SOW is associated with more societal WB if in the new state some members of society experience more WB and no members experience less: *Pareto improvements* are assumed ethically right. And if in the new state some members

### Welfare Economics,

**Fig. 2** Four WB combinations

experience less WB and none experience more, a move to the new state is wrong: *Pareto deteriorations* are wrong. It follows that policies that increase the WB of all members are right and those that decrease the WB of all members are wrong. By the Pareto criteria, the red-diamond combination of WB's produces more societal WB than the gray-rectangle combination (everyone has more WB), also more than the yellow-heart combination. Even though Barney and Wilma have the same levels of WB in the brown-hexagon and gray-rectangle combinations, the brown-hexagon is Pareto preferred because Fred has more WB. But the pairs, (brown-hexagon)/(red-diamond), (brown-hexagon)/(yellow-heart), and (yellow-heart)/(gray-rectangle) can't be ranked based on the Pareto criteria.

But, beyond the Pareto criteria, welfare economists don't agree on which, if any, additional restrictions should be imposed on the mapping from members' WB to societal WB. But, without additional restrictions, welfare economics only implies that Pareto improvements are right, deteriorations wrong.

Complicating further, whether a policy is a Pareto improvement or deterioration rests on who is, and is not, a member of society, which brings us back to "Who counts?". Do foreigners count? Do individuals not yet alive? Do non-human animals? Identifying society's members is critical to determining whether a policy will increase societal WB. If, for example, a Canadian government policy increases the WB of all Canadians while decreasing the WB of some residents of the USA and France, it can be made a Pareto improvement by concluding that effects on foreigners don't matter – that foreigners are not members of society. In terms of Fig. 2, shifting from the gray-rectangle combination to the yellow-heart combination becomes a Pareto improvement if Barney is exiled from society: it wasn't when he was a member.

Many welfare consequentialists assume that the WB of all sentient individuals (human and otherwise) count. In exception, most welfare economists exclude them. Welfare economists want someone else to decide which humans count.

### Liking Vs. Wanting/Desiring

An individual *liking* an object, action, or activity means experiencing it increases her WB, so welfare economists want you to experience what you will like. Desiring something does not mean you will like having it. Wanting and desiring as synonyms: one has a longing or craving. Examples include lusting, pining, and yearning.

The Neoclassical theory of choice assumes that the individual has an ordering of bundles based on preference, as in *Bundle j* is preferred to *Bundle i* (ranked higher) without specifying whether the ordering is in terms of liking (realized WB) or the fulfillment of wants and desires (bundles that fulfill more wants are ranked higher). Neoclassical economists tend to assume the two orderings are the same – or almost the same. Research in psychology and neuroscience indicates that behavior is driven by wants and desires, and while what we want and desire is often what we will like, sometimes there is little relationship between the two. [See, for example, the referenced articles by the neuroscientist Kent Berridge whose lab (Berridge 2005; Berridge and Aldridge 2008; Kringlebach 2013; Berridge and Robinson 1998; Wyvell and Berridge 2000) has separated liking from wanting. See also Chap. 18, From "Experienced Utility to Decision Utility," in the textbook *Neuroeconomics*. Morey (2021) summarizes from a welfare- economic perspective.

If the two ordering diverge, the distinction is critical to welfare economics. The adjective "welfare" suggests that the ethical objective is more WB, not more want and desire fulfillment, so we want to distinguish between welfare consequentialism and *want/desire consequentialism*. As noted, Singer advocates for the latter, not the former.

If Neoclassical choice theory assumes the individual's ordering is based on their WB, each individual maximizes their WB subject to their constraints, implying that in a Robinson- Crusoe society of one, the individual will always do the right thing (behave welfare-economic ethical). But if his ordering of bundles is based on wants and desires and this ordering differs from an ordering based on his WB, he will make wrong

choices, implying that limiting his freedom might be ethically preferred, even when his choices do not affect others – paternalism can be right.

For this entry, Welfare economics is about WB, not want/desire fulfillment. While wants and likes are often in sync, they are not always in sync.

*Is an individual's level of WB cardinally meaningful, or only an ordinal concept? And the implications for mapping from the well-being of members to societal WB.*

Neoclassical-choice theory only requires that the individual has a complete ordering of bundles: it does not require that WB has cardinal properties. (The predictions of Neoclassical Choice theory are unaffected by whether WB is cardinal or only an ordinal property. An ordering of bundles has cardinal properties if its meaningful to WB, compare a shift from Bundle  $i$  to  $j$  with a shift from Bundle  $k$  to  $l$ . (In contrast, classical economists assumed WB cardinally meaningful). (Note that Fig. 2 does not imply the individuals' WBs are cardinally meaningful: no numerical scales were attached to the axes.)

Whether one assumes WB is cardinally meaningful affects whether, and how, one might map from the WB of members to societal WB. The easiest to understand is assuming an individual's WB is strongly cardinal (numbers can be associated with each bundle such that the differences between and ratios of these numbers are WB meaningful) and they can be WB-compared across individuals. Call this case *cardinal/comparable*. For this case, one possible mapping, of many, to societal WB is the simple sum of all the member's WB in that State-of-the-World. Call this *aggregate WB*. In terms of Fig. 2, WB numbers would be attached to each level of WB for each individual, these numbers would be cardinally comparable, and one would simply add the three numbers. (There is no presumption in welfare economics, that everyone's WB counts the same, so another simple mapping would be Fred's WB plus Wilma's WB plus  $\frac{1}{2}$  of Barney's WB: Barney counts but less).

At the other extreme, one might assume, as many welfare economists do, that each individual has a WB-ordering of bundles, but WB has no cardinal properties and is not comparable across

individuals. Call this case *ordinal/incomparable*. In this case, one can't conclude anything about the ordering other than State-of-the-World  $m$  is ranked higher than  $k$  if the shift from  $k$  to  $m$  is a Pareto improvement. And a Pareto-inferior SOW is ranked lower.

The other two possibilities are *cardinal/incomparable* and *ordinal/comparable*. Whether WB does, or does not, have cardinal properties is an unanswered empirical question.

The point is that, while it is easy, in principle, to say that one should judge an action on whether it increases or decreases societal WB, whether it does, depends, almost always, on what additional properties are imposed on the mapping, whether a mapping with those properties can even exist (see, e.g., Arrow 1961/63), and who is a member of the society. Another way to make this point is that, except for Pareto improvements and deteriorations, one can't determine, for every pair of states of the world, which in the pair produces more societal WB, unless one specifies a complete mapping, but doing so is fraught with difficulties and disagreements. And, assuming that WB has no cardinal properties and that individuals' WB is not comparable across individuals, makes mapping even more difficult and contentious.

An aside: *an increase in efficiency* (a shift from one State-of-the-World to another such that the gainers could compensate the losers such that there would be no losers if the compensation occurred – a *Potential Pareto improvement*) does not imply that the shift is an increase in societal WB. Even though it is tempting to assume increasing efficiency is always welfare-economic ethically preferred; this is not true. [For example, imagine Donald steals, from you, your deceased grandmother's pearl pendant. Imagine his willing-to-pay for it is \$10 K – he likes antique pendants and is rich. You, on the other hand, are poor so would have sold it, with regrets, for \$1 K. The stealing is efficiency increasing but that does not imply that the theft increased societal WB.]

Said another way, an increase in net real wealth does not imply that societal WB has increased. Two corollaries are projects and policies that pass a benefit-cost test, while efficiency increasing, do not necessarily increase societal WB, and those

that fail a B-C test do not necessarily decrease societal WB. Of course, one could assume the ethical objective is not more societal WB, but rather more wealth (Posner 1983), but it's not a welfare-economic ethic.

Despite this, many economists succumb to the temptation and advocate for increased efficiency, suggesting that increased efficiency leads to more societal WB.

### Implications of the Welfare-Economic Ethic

Since welfare economics is a type of welfare consequentialism, your motivations and intentions play no role in determining whether your behavior is ethical. Whether your great-grandmother had killed the baby Hitler because she believed it would save the world from WWII and the Holocaust or because she did not like his crying is ethically immaterial. Whether one intended to start the forest fire or save the drowning baby is also immaterial: all that matters is whether the forest burned and whether the baby drowned.

Why and how an outcome resulted (the process) is also ethically immaterial, so whether a policy is right or wrong is unaffected by whether it was chosen by a democratic process or a dictator: a dictator who increases societal WB is ethically preferred to a democratic government that doesn't. Most ethicists, and most people, care about consequences but also care about process, so reject consequentialism.

Killing one person to save five (the classic trolley problem) is the right thing to do (Edmonds 2013a, b). But most people believe it is wrong to spring the trapdoor that drops the fat guy onto the track, gently stopping the trolley, killing one but keeping the trolley from crashing and killing the five aboard.

No actions are inherently right or wrong: it depends on their consequences. For example, lying is not inherently wrong; it is circumstance specific. Lying to your partner about a sexual tryst might increase everyone's WB.

Welfare economics does not parse right from wrong forms of WB, WB is WB, so the pleasure Billy gets from torturing cats counts toward societal WB as much as the WB he gets from his

mother's love. The pleasure some of us get from feeling superior to others and treating them badly also counts. If cats are not members, and no members care about them, it is right that Billy tortures cats. If the inferiors are members of society, but the pleasure we get from discriminating against them exceeds the suffering we cause, discrimination is ethically preferred. It is easy to create example actions and policies that the welfare-economic ethic would endorse (e.g., sadistic acts, killing humans for fun and sport, racial discrimination, torture) but would make many people scream "No" (Morey 2018).

If a welfare economist defines societal WB as aggregate WB (many don't), how the levels of WB are distributed is ethically immaterial as long as the sum remains the same. An individual is no more than a WB generating container: their individualism counts for nothing. If societal WB is aggregate WB, increasing WB inequality is always ethically preferred if it increases aggregate WB.

Is more freedom welfare-economic ethically preferred? Not necessarily. Consider four cases: (1) individuals always choose their highest-ranked feasible bundle ordered in terms of their WB, and their choices and behaviors impose no external costs or benefits on other members of society. (2) Individuals choose this way, but their choices impose costs and benefits on others. (3) Individuals choose their highest-ranked feasible bundle in terms of want/desire fulfillment, and this ordering differs from their ordering in terms of WB. Only in Case 1, can we be certain that more freedom will increase societal WB; in the other cases, it could reduce it. Case 2 implies that freedom to choose will allow everyone to maximize their own WB, but this won't necessarily increase societal WB because of the effects of one's actions on others. In Case 3, restricting an individual's behavior can increase their WB.

Many ethics consider how to live an ethical life – the ethical objective of Aristotle, the Buddha, and modern virtue ethics. If one assumes that the individual must choose their highest-ranked feasible bundle, this aspect of ethics is off the table: the individual can't choose to be more or

less ethical – an individual can only be coerced into being more ethical.

### Most Ethicists Reject the Welfare-Economic Ethic, So Do Normal Folk

Most welfare consequentialists reject welfare economics. And most ethicists reject welfare consequentialism. Arguments that welfare consequentialists use to reject welfare economics include emotional WB and pleasures don't necessarily translate into WB, and WB produced in an abhorrent way should not count. See Sumner (1996), Broome (1988), and Harsanyi (1982) who distinguished between true and manifest WB.

Many ethicists reject WC, and so welfare economics, simply because it can sanction policies and actions like lying, murder, torture, and racial discrimination. Some reject it because it assumes no fundamental rights, others because they believe the process is also ethically material, others because they believe that only process and duty are ethically material.

Many ethicists believe that while increasing WB is not a bad thing, it is not the criteria for determining right from wrong. This group includes duty-based ethicists (e.g., Kantians), advocates of rights theory, and virtue ethicists.

Kant's ethic emphasizes autonomy and doing one's duty: your behavior is ethical if it is motivated by an intention/will to do your duty, if not, it is unethical (Johnson and Curton 2021). Processes not consequences are what determine right from wrong – the exact opposite of welfare economics. Kant's *universality principle*, the bedrock of his ethic, is your actions are right if you would want everyone to behave like you, and wrong if you would not – you would be happy to make your behavior the law. ["Act only according to that maxim whereby you can at the same time will that it should become a universal law." This is the first formulation of Kant's *Categorical Imperative*, a commandment/imperative with no exceptions for how to live your life]. You have a duty to behave according to his universality principle – Kantian ethics is *deontological*: from the Greek words for duty (*deon*) and study (*logos*). Modern students of Kant's ethics include Paul Guyer, Thomas Hill, Barbara Herman, Kristine

Korsgaard, and Allen Wood. A modern version of right and wrong based on a Kantian-type moral contract is Thomas Scanlon's book, *What We Owe to Each Other* (2000): a principle is right if it can be justified to reasonable others.

*Rights Theory* judges your behavior moral if you had the right to do what you did, wrong if you didn't; and wrong if your action violates the rights of another (Wenar 2011). It is based on you, and others, having fundamental rights, for example, "the right to life, liberty, and the pursuit of happiness." Rights impose duties on others: you must uphold my rights. Rights are typically thought of as unconditional in that the right-holder has the right under all circumstances. John Locke (1632–1704) and Thomas Jefferson (1743–1826) were rights theorists. Modern rights theorists divide into *will theorists* (e.g., H.L.A. Hart) and *interest theorists* (e.g., Joseph Raz). Exercising a right is right even if it decreases societal WB and violating another's right is wrong even if it increases societal WB.

Welfare economists, being consequentialists, do not recognize fundamental rights; they would, for example, talk about the right amount of free speech in the same way they talk about the right amount of pollution. Welfare economists who advocate for property rights do so only because they believe that having and enforcing property rights will increase societal WB, not because they believe in an inalienable right to own stuff.

Virtue ethics is about being virtuous not about achieving more societal WB (Hursthouse 2001 and 2013). Its three pillars remain the Aristotelian concepts of *arête* (excellence or virtue), *phronesis* (practical or moral wisdom), and *eudaimonia* (true happiness/flourishing/moral happiness). Virtue ethicists include Plato, Aristotle, and Adam Smith. In the nineteenth and early twentieth centuries, virtue ethics was eclipsed by Kantian ethics and welfare consequentialism, only to reemerge in 1958 with the publication of *Modern Moral Philosophy* by the British philosopher Gertrude Anscombe (1958) – it had never lost its street appeal. [She coined the term "consequentialism."]. She rejected welfare consequentialism because "it commits one to endorsing evil

deeds” and concluded that Kantian ethics is “just incoherent” (Driver 2014).

Consider also ethics based on freedom: more is ethically preferred until, of course, it leads to terrible acts, for example, the liberalism of John Stuart Mill (Gaus et al. 2020). If, and only if, one restrictively assumes we always choose our highest-ranked WB bundle, and our choice has no effect on other members, does the welfare-economic ethic always advocate for more individual freedom.

Normal folk don’t subscribe to a welfare-economic ethic: while people care about their own WB, most don’t determine whether an action is right or wrong based on its effects on societal WB: for many, societal WB does not seem important, or they view society very narrowly – only their tribe.

In the West, people predominately judge on just two criteria: (1) justice/fairness (treating others in proportion to their actions and intents), and (2) caring for others and protecting them from harm (harming others is wrong, those who cause harm should be punished, and those who care for others should be rewarded) (Morey 2018). See also Henrich et al. (2010) and Haidt et al. (2003), Haidt and Graham (2007), and Haidt (2012). Non-western adults and religious conservatives add two additional criteria: (3) loyalty to the group, including respect for authority and fulfilling group obligations; and (4) an ethic of holiness (as God’s creatures we must uphold the sanctity of our holiness).

### Welfare Economics Is Not Utilitarianism

That it is, is a common misconception: while welfare economics is a type of welfare consequentialism, it is neither the utilitarianism of Bentham nor modern utilitarianism. [One explanation for the misconception is that Bentham utilitarianism was initially, the primary form of welfare consequentialism. Another is economists use a word with the same roots, “utility.”]. It also differs from other forms of modern welfare consequentialism.

Bentham, the father of utilitarianism, assumed only one type of WB – a pleasure minus pain continuum. Most welfare economists assume that there are different types of WB which are all

WB-commensurable. Bentham further assumed that WB has cardinal properties and can be compared across individuals.

Bentham specified society as all sentient creatures. Duck and spider pain counts equally with human pain. Most welfare economists reject this.

Bentham defined societal WB as the simple sum of net pleasures (his *felicity calculus*). Welfare economics mostly reject this mapping. Some believe that no complete mapping can exist, because either they assume WB has no cardinal properties or, if it does, WB is not comparable across individuals. Those who accept cardinality and comparability typically reject aggregate WB because it assumes the distribution of WB is immaterial. Besides, few welfare economists advocate for any particular mapping, either complete or mostly complete (The mapping is complete if all conceivable vectors of the well-beings of members map into a societal-WB ordering).

The modern face of utilitarianism is Peter Singer, a want/desire-fulfillment consequentialist, not a WB consequentialist (There is also *act* and *rule* utilitarianism). Of course, if you assume the individual’s ordering of bundles in terms of wants and desires is the same as the ordering in terms of WB, one can argue that welfare economics is a modern type of his utilitarianism.

*Modern economic philosophers who reject the welfare-economic ethic include*

John Rawls (1921–2002), Amartya Sen (1933–), and Partha Dasgupta (1942–).

*Issues and complications not discussed:*

- How to estimate an individual’s WB and changes in its level.
- Welfare economics in a world of risk and uncertainty.
- Things are more complicated if people care about their relative position (improving your position in society increases your WB but decreases the WB of others).

## Wells Fargo and Corporate Crime

John Heeren and David Shichor  
California State University, San Bernardino, CA, USA

### Synonyms

Fraud; Illegality

### Introduction

In the second decade of the twenty-first century, one of the largest banks in the USA, Wells Fargo, was involved in fraudulent business practices harming millions of its clients. The scale of the crime was massive, as was the variety of investigations and penalties that followed. As a banking entity in America and globally, Wells Fargo

engaged in competition with other financial firms in pursuit of profits, market share, and prestige (Stone 1975). Like other businesses, the structure of Wells Fargo’s competitive practices was largely forged by the existing organizational culture. This set of normative guidelines sets out what behavior is legal and ethical, what is proscribed, and a set of sanctions for enforcement. A critical element of this culture is the emphasis placed on ethics and compliance by top management; this is likely to filter down to line employees.

### Crossing Ethical Lines in Corporate Crime

In attempting to increase profitability, the management of Wells Fargo set very high sales performance goals for lower-level employees. Within this culture of high-pressure sales demands, especially cross-selling or selling additional products to existing customers, many of these lower-level employees opened thousands of fictitious accounts without their clients’ knowledge. It was estimated by regulators that over several years more than two million accounts and well over five hundred thousand credit card applications were implicated in these fraudulent operations (Shichor and Heeren 2021). These manipulations were a blatant “violation of trust” (a hallmark of white-collar crime) of thousands of the customers who believed in the honest business practices of this major bank but were harmed and victimized by that institution. Since these violations were publicly revealed in 2015, many other offenses by the bank have surfaced, including charging for unrequested auto insurance, closing of accounts without customers’ approval, late charges for mortgage payments caused by the bank’s refusal to reinstitute mortgages from bankruptcy status, etc.

To begin to think of corporations as being ethical entities, we might consider how responsibility is conceived in the legal realm. In most instances, for a person to be thought of as responsible for a legal offense, what needs to be shown is their criminal intent, *mens rea*. Corporations,

however, are considered to be “juridical persons” with many, but not all, of the rights and responsibilities of real “natural” persons. With a corporation of any significant size or complexity, establishing the *mens rea* of company misdeeds is difficult to discern as the collective decision-making is convoluted and hidden. As Stone (1975, p. 3) notes, corporations have “no pants to kick or soul to damn.” However, when corporate leadership has broad agreement on policies which are ratified year after year, and it is known, as it was in the Wells Fargo case, that those policies produce criminal conduct among lower echelon employees, it is reasonable to consider the corporation as responsible and label the conduct of the collective entity as unethical. In the Wells Fargo case, there were compliance failures across a wide gamut of governance groups, making it reasonable to assign responsibility to the corporation as whole. While the legal system might consider the lower-level employee to be culpable for fraud, forgery, or identity theft, a major part of the ethical burden for thousands of employees committing millions of crimes would logically be with the corporate leaders. This can be likened to the head of a criminal syndicate who instructs his lieutenants to extort money from victims “no matter how you have to do it.”

In light of the above, it is useful to single out the unethical activity of Wells Fargo management with respect to three significant stakeholders: customers, employees, and investors. First, as noted above, for customers the central ethical violation was the breach of trust. As Shapiro (1984) stated, trust is “the impersonal guarantee that representations of expertise or risk or financial condition can be taken at face value and that fiduciaries are not self-interested.” When acting as an agent for a client, bank employees are expected to put the interests of the client ahead of those of the bank or the employee. This would be the case in such simple tasks as accepting deposits or offering financial advice. Wells Fargo’s *Vision & Values* guidelines disseminated to all “team members” states: “Honesty, trust and integrity are essential for meeting the highest standards of corporate governance.”

The employees of Wells Fargo engaged in overlapping acts of wrongdoing, violating trust in multiple ways. As the problems became clearer to one Wells Fargo executive, she/he confessed, “Our people opened unauthorized accounts. This is like lying and stealing, which your mother taught you was really bad (Office of Comptroller of the Currency 2020, p.9).” So, one of those unethical acts is the fraudulent act of opening more accounts than customers desired or requested. This was often facilitated by identity theft or forgery in which the employee posed as the client in signing up for these extra services. In addition, bank employees also thieved money or property from the customer. In many cases, this was in the extra fees paid by the clients, but the larger-scale theft showed up in the auto insurance scam. Over 800,000 car loan customers were automatically put into insurance to cover the purchase, even if they already had auto insurance. Of those getting the unrequested insurance, about 275,000 went into delinquency and 25,000 had their autos wrongfully repossessed.

One of the other values touted by Wells Fargo is the importance of Diversity and Inclusion, a widely espoused ethical component of “corporate responsibility.” An ironic consequence of the Wells’ corporate emphasis on ever-increasing sales was that the groups most often targeted for fraud were many of the same groups that the bank mentioned as needing corporate outreach. Among these groups were non-native speakers, minority groups, mom-and-pop stores, native Americans, the elderly, and other vulnerable groups. These were the groups that were seen by bank employees as the easiest marks for the ploy of being sold additional banking products and least likely to notice and/or complain about unwanted accounts. One Wells salesperson described this as like “lions hunting zebras” in their looking for the ones most susceptible to being caught.

The second group of stakeholders to be victimized by the wells Fargo’s policies were the employees. While these line employees were exploited by their corporate supervisors, they were also the instruments through which customers were victimized. The immediate form their exploitation took was the continual harping

on the importance of meeting sales goals. When an employee fell short of their goals, they were at times subject to special coaching and harassment, which also could lead to their being asked to devote extra unpaid time to the sales effort. Beyond this, employees often faced an ethical dilemma created by Wells Fargo. On the one hand, employees were asked to embrace the Vision & Values credo widely expressed by the bank. In addition to taking a course in the corporate Code of Ethics, employees were expected to complete annual recertification. One section of this Code stated: "Steering a customer to an inappropriate or unnecessary product to receive sales credit harms the customer; it is an unacceptable practice that violates both the spirit and the letter of our incentive programs and this Code."

The other horn of the dilemma was that employees were implicitly asked to ignore those values and that vision in order to try to meet the extraordinary sales goals and maintain or improve their position within the company. During approximately the same period (2011–2016) when 5300 employees were terminated for ethical violations in sales practice, another 8500 were terminated for sales performance issues, including failing to fulfill sale goals. The Wells Fargo message from direct supervisors was clear to many employees: It was more risky to ignore sales goals than to ignore the ethical standards which were supposed to guide sales.

The Wells Fargo corporate commitment to Vision & Values was backed up by a dedicated Ethicsline to which employees were told they could call to report unethical activity in the bank. However, many of the employees who did resort to using this channel learned that their complaints had little impact in correcting ethical lapses. Moreover, in some cases in which the employee became too insistent in reporting misdeeds, they became targets of corporate retaliation, in spite of the fact that the bank's Code of Ethics vowed there would be no retaliation. At times employees were advised to "go along" with the sales-oriented culture or seek other employment. In some instances, the employee was terminated as out of step with corporate goals. Once again, the message from the corporation to the employee was

that ever-increasing sales were important; don't let ethics stand in the way. These corporate responses to employees who tried to adhere to high ethical standards exemplify "bad faith."

One additional policy of Wells Fargo showed the extent to which unethical sales behavior was tolerated. By around 2012, the bank began to notice the rise in complaints, Ethicsline calls, and customer lawsuits related to sales misdeeds. While there were several ways in which employees could cheat the system, corporate decision-makers decided to monitor just two of those. Although there were indications of many thousands of cases of these misdeeds each month, corporate management decided to only investigate in more detail the worst 0.01% of these. For example, if 30,000 cases of "simulated funding" were found through monitoring, Wells Fargo management only investigated three. Later, this was expanded somewhat so that 0.05% were investigated. It is apparent, then, that if about 1000 employees were fired each year for sales misdeeds, many, many thousands more were committing the same offenses. The corporate control policies of Wells Fargo were wide open to tolerating unethical behavior on a huge scale.

The third stakeholder group that was impacted by unethical actions of Wells Fargo were the investors. It is helpful to see this group in a broad perspective, so it may make sense to include the Board of Directors which represents the interests of investors. We might also include the potential investors who can be regarded as the stock-savvy part of the American society who follow the activity of corporations fairly closely. Among the values mentioned in the 2014 version of Wells Fargo's Code of Ethics is demonstrating responsibility for the reputation of the company. Preserving and fostering that reputation is the duty of management, the Board of Directors, and all lower-level team members. Because of the unshakeable commitment to short-term gain in profit and market share, top management failed badly in their responsibility to uphold the company's reputation. Their actions exposed Wells Fargo to great risk and ignored the longer-term interests of the company. While previously Wells Fargo had been among the leaders

in the *American Banker*/Reputation Institute surveys, by 2017 it had fallen to last place. Moreover, while other major banks' stock market position improved substantially in the years after 2016, that of Wells Fargo saw little or no growth in stock price (Office of Comptroller of the Currency 2020). Obviously, the brunt of this managerial short-sightedness fell on investors.

Another morally unprincipled action taken by the corporation with respect to investors and the Board was the incomplete and inaccurate reporting of information about the unfolding debacle of misconduct in sales practices. It is now known that sales misconduct was a problem as early as 2002 when there was a mass termination of employees for sales misconduct at one bank branch in Colorado. The Board's Legal Department realized they could not fire all employees from managers to tellers since it would jeopardize the bank's fidelity bond, which proscribed "dishonest acts." Ultimately, the bank was able to fire many of the employees and get a fidelity bond exception approved by their underwriter (Independent Directors 2017). By late 2013, news stories in the *Los Angeles Times* (Reckard 2013) alerted investors and the Board to the corporate risk posed by the widespread sales misdeeds. Given several opportunities to fully inform the Board of the source and scope of the moral and legal hazards of cross-selling, members of the Community Bank and other corporate officials downplayed its significance, misinforming about the duration, the numbers of employees terminated, and the harm to customers. In May of 2015, the head of the Community Bank of Wells Fargo told the Board's Risk Committee that only 230 employees had been terminated for sales violations; the cause of the problem was "bad apples" with bad intentions; and the problem was being effectively controlled by corporate policies. It was about a year later that the Board found out that over a thousand employees had been fired annually for faulty sales over a several year period (Independent Directors 2017).

Another issue related to those of deception and misinformation is the shirking of responsibility that takes the form of "plausible deniability." Hoyk and Hersey (2008: 73) refers to this generally as the "tendency which takes credit for

success and attributes failure to external causes." In the Wells Fargo case, when CEO, John Stumpf, appeared before congressional committees, he placed the blame on an "ethical lapse" among lower-level employees. At the same time, Stumpf maintained that until 2013 he was not aware of the extent of these harmful practices going on in the thousands of branches of the bank and among the tens of thousands of agents of the corporation. This is a denial of responsibility based on the diffusion of group decision making. As Hoyk and Hersey (2008: 25) note, "Ethical transgressions done by a group can easily be blamed on other members." The plausibility of this denial of responsibility was facilitated in the Wells Fargo case by the organization's high degree of decentralization, which made isolated pockets of knowledge very likely. This has been referred to as "concerted ignorance" which is a way to cover up when openly revealing certain policies and practices would threaten the cohesion in the organization. In other words, this comes about when executives, midlevel managers, and line workers have a common interest in limiting the knowledge to be obtained about each others' activities. In the Wells Fargo instance, this rationale for misdeeds was belied when it was revealed that in 2011 a group of fired employees wrote directly to CEO Stumpf about the wide-scale fraud going on in the bank with the encouragement of managers.

Although the recent financial debacle with Wells is a single case, it does serve to illustrate that corporations, even as juridical persons, can be regarded as ethical entities which have moral and social responsibilities. Among these responsibilities are those of managing corporate risk and ensuring legal and ethical compliance with rules. More fundamental than this, however, is the responsibility to consider the consequences of collective decisions. To be sure, a heavy corporate emphasis on ever-increasing sales yields great profits. Beyond this, however, the Wells Fargo case shows that the pursuit of such a goal must be thoroughly tempered by a stress on the means of its acquisition.

be able to effect action” (Near and Miceli 1985: 4). Along with Terry Dworkin, Janet Near and Marcia Miceli can be seen as having laid the foundation of whistleblowing scholarship in the fields of, respectively, law, sociology, and psychology (see, e.g., Miceli et al. 2008). De George (1981, 1990) may be seen as one of the key business ethics scholars on the question when we have a moral duty to blow the whistle.

## Shifting Views on Whistleblowing

Initial empirical scholarship on whistleblowing tried to determine demographical factors, personality characteristics, and situational determinants of whistleblowers, however without a very convincing consistency of findings (Mesmer-Magnus and Viswesvaran 2005).

Perhaps that is because for a long time, whistleblowing was operationalized in research as a one-off conscious decision by an individual (Vandekerckhove and Phillips 2019). In bearing with that assumption, scholars argued for a conceptually clear distinction between internal and external whistleblowing (e.g., Jubb 1999), with internal whistleblowing denoting workers reporting wrongdoing to someone inside their organization (e.g., hotline or senior manager) and external whistleblowing referring to workers reporting wrongdoing to someone outside of their organization (e.g., regulator or journalist).

However, the current whistleblowing scholarship takes a process view on whistleblowing, seeing internal and external whistleblowing as part of the same dynamic in which people make a number of attempts to raise a concern. This view was first put forward by Rothschild and Miethe (1999), who found that many of their interviewees had become whistleblowers inadvertently, merely seeking someone who would listen to them. Vandekerckhove and Phillips (2019) more recently confirmed the process view of whistleblowing in a study of 1000 cases, suggesting that the sequence in whom people report wrongdoing to is characterized by an increased perceived impartiality of the recipient, rather than from internal to external. Thus, it is not uncommon for whistleblowers to report

## Whistleblowing

Wim Vandekerckhove  
University of Greenwich, London, UK

## Synonyms

Disclosure; Reporting wrongdoing; Speak up; Whistleblowing

## Introduction

The most commonly used definition of whistleblowing is: “disclosure by organization members (former or current) of illegal, immoral or illegitimate practices under the control of their employers, to persons or organizations that may

wrongdoing more than once internally before considering blowing the whistle outside their organization.

The process view on whistleblowing has also been taken up in Organization Studies, with emerging scholarship on how the whistleblowing subject and whistleblowing identity are gradually formed in interaction with organizational and professional norms, group exclusion, and dynamics of both support and retaliation (e.g., Contu 2014; Kenny 2018; Weiskopf and Tobias-Miersch 2016).

## Retaliation

Smith (2014) provides an overview of how retaliation against whistleblowers has been studied thus far. He notes that “contrary to the popular wisdom, most whistleblowers do not suffer” (p. 234). The most common prevalence of retaliation in whistleblower studies is between 16 and 38%. As Smith (2014) notes, there is obviously an issue of sampling inconsistency here that makes it hard to compare between studies. However, there is also an issue of how whistleblower suffering is conceptualized. Smith (2014: 234) notes that “while not all whistleblowers suffer, when they do, they tend to suffer in multiple ways.” A useful distinction is made by Cortina and Magley (2003): retaliation can be work-related and formal (e.g., demotion, transfer, reduction in working hours), but it can also be social or informal (e.g., being shunned by former friends). Studies differ in how they “capture” whistleblower suffering in data categories and variables. Quantitative studies have a tendency to add up types of suffering or rank types according to assumed severity of the harm. Smith (2014) criticizes that, arguing that “we do not know which types of retaliation and suffering will prove more or less important for whistleblowers in different circumstances” (p. 236).

Qualitative studies take a different approach to conceptualize whistleblower retaliation. For example, Kenny (2019) and Kenny et al. (2018) draw on Alford (2002) and Butler (1997) to show that whistleblowing entails a rupture of one’s identity, both professionally as well as privately.

Kenny’s work focuses on whistleblower’s struggles to redefine their identity vis-à-vis retaliation, rather than try to categorize and weigh the retaliation itself.

## Whistleblowing and Information Ethics

Wim Vandekerckhove  
University of Greenwich, London, UK

### Synonyms

Raising a concern; Reporting wrongdoing; Speak-up

### Definition

Whistleblowing is “the disclosure by organization members of illegal, immoral or illegitimate practices under the control of their employers, to persons or organizations that may be able to effect action” (Near and Miceli 1985). Whistleblowing is currently also referred to as speak-up, reporting wrongdoing, or raising a concern.

Information ethics (IE) is an ethical framework that “evaluates the duty of any moral agent in terms of contribution to the growth of the infosphere [...] and any process, action or event that negatively affects the whole infosphere – not just an informational entity – as an increase in its level of entropy and hence an instance of evil” (Floridi 2008).

### Whistleblowing at Three-Tiers

Research into whistleblowing that distinguishes between internal and external whistleblowing has mainly assumed whistleblowing is a one-off decision and action. Hence, upon perceiving a situation as wrongdoing people make certain considerations and decide to either remain silent, report wrongdoing internally (i.e., to someone who is part of or mandated by the organization), or blow the whistle externally (i.e., to someone independent of the organization such as a regulator or the media). Their whistleblowing can be effective or not in stopping the wrongdoing (Near and Miceli 1995).

An alternative stream of research takes a sequential approach to whistleblowing. Rather than a single decision, whistleblowing is a process in which people can make a number of attempts to raise a concern or report wrongdoing to different recipients. The decision to report wrongdoing again and the choice of recipient depend on the response of the previous recipients. Extant research suggests that the vast majority of external whistleblowing is preceded by internal whistleblowing (Donkin et al. 2008; Kenny 2019; Rothschild and Miethe 1999; Skivenes and Trygstad 2010; Vandekerckhove and Phillips 2019). A common pattern in whistleblowing sequences appears to be internal – regulator – media (Vandekerckhove and Phillips 2019). It resonates with regulatory policies that provide protection for whistleblowers by specifying conditions that need to be met at three different levels: internal reports, reports to regulators or enforcement agencies, and public disclosures. This is also called the three-tiered model (Vandekerckhove 2010).

### Whistleblowing and Information

This sequence has implications for the value of the information disclosed by whistleblowing in the sense that whistleblowing cannot be understood separately from its facilitation – that is, whether recipients respond positively or negatively. The three-tiered model allows to put forward the following scenario as typical for whistleblowing as a process:

- Person A works at organization ORG1 and blows the whistle about wrongdoing at ORG1 to regulator REG.
- If this is the case, then it is likely that A has previously blown the whistle to someone within ORG1 (e.g., a line manager, someone in top management or a hotline) and that ORG1 has responded negatively (i.e., by neglecting the report, by harming the whistleblower, or both) or at least that the whistleblower perceives it that way.
- It is now up to REG to investigate the alleged wrongdoing and intervene if necessary.

- If REG fails to stop wrongdoing or to convince the whistleblower that it has taken the appropriate action, then it is possible that A will make a public disclosure, for example, to a journalist, who might publish about wrongdoing at ORG1 and negligence from REG.

In this sense, whistleblowing to the media is an indicator of failing organizations and failing regulators (Vandekerckhove 2018). If organizations or even regulators are successful at handling whistleblowing, there would be no whistleblowing in the media; the public would not know the whistle had been blown. However, it is epistemologically unsatisfactory to assume that “no news is good news”; that assumption only holds if we could believe that legislation that protects whistleblowers is fully effective as a deterrent to neglecting and retaliating against whistleblowers.

Hence the question remains how we can know whether organizations and regulators are successful at positively facilitating whistleblowing? For that we need information about whistleblowing activity in organizations and to regulators, without the whistleblowing itself being public.

## Information About Whistleblowing

From an information ethics (IE) perspective more can be done than simply assuming that no news is good news. Luciano Floridi (2008, 2010, 2011) is a leading scholar in information ethics. Floridi’s IE principles follow a consequentialist reasoning favouring the infosphere. Floridi’s principles prescribe that informational noise should not be caused but should be prevented and removed. In addition, we should promote the flourishing of informational entities (such as organizations) as well as the whole infosphere by preserving, cultivating, and enriching their properties.

In light of these principles, having regulatory policies that promote whistleblowing – whatever the form of these policies, for example, protection of whistleblowers or financial rewards for whistleblowers – does not do enough to reduce informational noise and promote the flourishing of organizations as informational entities. Such

regulation allows us to know when organizations and regulators have failed – namely when there is public whistleblowing – but not when they are getting it right, and not how good they are successfully facilitating whistleblowing. It is also possible that a whistleblower is mistaken or even that someone deliberately makes a false accusation. A public untrue disclosure – whatever the motivation is – creates informational noise and harms the flourishing of informational entities. Whistleblowing that is not public (i.e., internal or to a regulator) can filter out untrue whistleblowing. Hence, organizations and regulators enhance their informational flourishing if other entities in the infosphere would have information about how organizations and regulators are handling reports of wrongdoing.

Obviously, when organizations are willing and able to respond positively to their internal whistleblowers (i.e. by correcting the wrongdoing), then organizations are better at their legitimate goals, regardless of whether anyone knows they have whistleblowers and are responding positively to them. But as information entities, organizations flourish more when they can let the world know that they are able and willing to respond positively to their internal whistleblowers. The same reasoning applies for regulators. The kind of information that – from an IE perspective – organizations ought to publish is aggregated data about whistleblowing activity under their responsibility. Generally speaking, the aggregated data consists of:

1. Number of reports made, with some specification as to type of wrongdoing
2. Number of investigations started, and further differentiating between ongoing and finished investigations
3. Number and type of actions taken toward wrongdoers, wrongdoing, and harmed stakeholders
4. Number of protective measures taken toward whistleblowers

There is little research into the effect of publishing such aggregated whistleblowing data on trust and reputation. Hence it remains unclear what the best data categories are.

## Conclusion

From an IE perspective, whistleblowing enhances the infosphere if:

- Untrue whistleblowing can be filtered out before whistleblowing becomes a public disclosure (i.e., at internal or regulator stage)
- Closure can be achieved with the whistleblower during the non-public whistleblowing stages, especially when whistleblowing is untrue (mistaken or intentionally false)
- Information is available in aggregated form about non-public whistleblowing

Each of these conditions is necessary but insufficient; all three need to be met if whistleblowing understood as a process is to enhance the infosphere.

## Women on Corporate Boards and Sustainable Development

María del Carmen Valls Martínez, Pedro Antonio Martín Cervantes and Alicia Ramírez Orellana  
Department of Economics and Business,  
University of Almería, Almería, Spain

## Synonyms

Business ethics; Corporate social responsibility; Gender equality

## Introduction

In 2015, the United Nations established 17 sustainable development goals to accomplish in 15 years, the so-called 2030 Agenda. The aim is to achieve a more equitable world, where the human being and the planet will be protected. The poverty alleviation, the health of the global community and the animal protection, water policies, sustainable energies, the pollution reduction, the quality educational standards, and gender equality are among these objectives, which have to be attained by governments, public and private companies, and any member of the society.

Corporate social responsibility (CSR) implies that, nowadays, firms have to be accountable for environmental, social, and governance (ESG)

criteria. The interest of CSR in management started with the publication, in 1953, of the book entitled *Social Responsibilities of the Businessman*. Then, the entrepreneur established the lines of the CSR according to her/his personality and philosophy. Later, in the 1980s, CSR evolved to become a commitment of the companies, which overcame the founder and considered the interest not only of shareholders but also of stakeholders (employees, customers, suppliers, government, and public, in general). However, in the early 1990s, arose appealing financial, social, and environmental scandals, which provoked the proliferation of ethics and conduct codes, legal rules to control risks, and the companies' implication within sustainable business models. Accordingly, in addition to their financial accounts, today, it is usual that companies publish periodical CSR reports, where they inform about their ESG practices and implications.

Moreover, every day more, private investors, as well as investment funds and pension plans managers, select their portfolios by considering the ESG scores provides by international rating agencies, such as Thomson Reuters, and the inclusion of the shares in a sustainable market index, as the Dow Jones Sustainability index or the FTSE4Good index (Miralles-Quiros et al. 2017). Therefore, the publication of CSR reports by private and public institutions has become a real duty to obtain the confidence of capital markets and accomplish the goals of the Agenda 2030.

The company board is the one that decides the strategic lines in management and, therefore, the composition of the board of directors is the key to monitoring the social and environmental behavior of the company. The link between the proportion of women on company boards and the CSR performance is extensive in management research. The next sections will explain the foundation for such a relationship. On the other hand, by considering that the fifth sustainable development goal is "gender equality," the interest in the female presence in managerial positions is growing since its implications are essential, as it will expose below.

## Gender Diversity on Board of Directors and Corporate Social Responsibility

One of the main drivers of corporate policies, especially in social and environmental issues, is gender diversity on corporate boards. The percentage of female directors is decisive in CSR. There is a discussion between homogeneity versus heterogeneity, with arguments for and against each option.

Diversity divides the group into two categories. The majority group tends to disregard the opinions of the minority group, which lead to a lower commitment of the latter, a greater extent of turnover and absenteeism. Both groups will have conflicts and dissatisfaction. These potential controversies will difficult the consensus on agreements and could retard the decision-making process. Consequently, the effectiveness of the direction could be questioned, especially in a competitive environment such as the current one, where the speed of response in the resolution of problems is crucial. In this scenario, women have to fight to be heard, which implies that their male counterparts often consider them as "tokens" and ignore their opinions (Rao and Tilt 2016).

However, the advantages of the heterogeneity overcome the drawbacks of the homogeneity and involve a problem solving of higher quality. Diverse groups analyze the decisions more thoroughly. They provide a broader perspective because of their different educational backgrounds and the various skills and experiences entail a competitive advantage. The alternative perspectives promote a critical examination of complex problems, avoid early decision-making and foster creative and breakthrough solutions. In a diverse group, the risk of corruption is lower, and the corporative government is strength.

Women have different characteristics than men. In general, women are more compliant with the ethical, accounting and financial standards, more philanthropic and environmentally conscious. Therefore, they are more oriented to CSR. Moreover, emotional intelligence is higher in women. They are more sensitive and empathetic and have a more democratic leadership, which lead them to a participative style at the

decision-making level, where the flexibility is an attribute.

Additionally, women exhibit more persuasive communal skills. Namely, they are generous, socially oriented, and concerned about the welfare of others, so they have a better understanding of the market. In short, the values that women assign to social issues are different. Because of their relational skills, women used to pay more attention to the needs of a broader range of stakeholders.

To sum up, women are more ethical and inclined to social and environmental issues, so a higher percentage of women on board of directors will increase the CSR performance of the company. “The Lehman Sisters hypothesis” considers that the consequences of the worldwide financial crisis, which began with the fall of the Lehman Brothers holding, would have been far less if women had held more management positions (Van Staveren 2014).

A large number of studies have analyzed the relationship between the percentage of women on company boards and CSR performance. Most of them revealed a positive influence of female directors on practices of CSR (Velte 2017). Only a reduced number of empirical research found a negative or no relationship (del Valls Martínez et al. 2019). It is essential to mention that these latter correspond to older analyses or studies made in developing countries. However, when the study is more recent, and it corresponds to developed countries, the influence is always positive. What is the reason for this difference? The cause could be due to the low number of women on corporate boards in emerging markets and old periods since the incorporation of women into management positions is recent and occurs mainly in developed countries. The gender gap, in general, is more significant in developing than in developed countries (World Economic Forum 2019).

## Theoretical Framework

A good number of well-established theories support the positive influence of women directors on

CSR performance (Ben-Amar et al. 2017; Liao et al. 2019).

The separation between ownership and management in corporations is the basis of the *agency theory*, which links corporate governance and reporting. This theory considers that managers (agents) could run the company in their interest, which is not always according to the shareholders’ (principals) profit. Corporations can minimize these agency costs by reducing information asymmetries. In this sense, the board of directors can force transparency and accountability. The composition of the company boards is decisive, and a higher percentage of female directors is more likely to increase the company’s audits and responsibilities, influencing CSR performance.

*Stakeholder theory* highlights the interaction between the company and its stakeholders (investors, workers, providers, customers, public authorities, NGOs, and the general public). The company performance in the short- and long-term and its survival depend on its relationship with stakeholders, who are interested not only in financial results but also in nonfinancial aspects. Companies use CSR reports to show their social and environmental performance to the stakeholders, and the different moral reasoning of women on corporate boards helps companies consider stakeholder claims in a more efficient way. If such expectations were not satisfied, the corporation would be in a risky situation. Thus, female presence is advantageous to the stability of the company.

*Stakeholder agency theory*, which is a mix of the two former theories, considers the company board both the principal of the managers and the agent of the stakeholders. Gender diversity reduces information asymmetry and the conflicts of interest between the managers and the different stakeholders, both internal and external. Thus, female presence on board can be an effective control mechanism to reduce stakeholders’ agency cost and reinforce the credibility of sustainable strategic management. Broader female presence on board of directors is usually related to more board independence. Therefore, gender diversity on corporate boards is a corporate

governance tool to influence CSR activities and, consequently, to strengthen the company's reputation.

According to *resource dependence theory*, companies are open systems, and the board of directors is the main link with the environment. A company's capability to survive depends not only on its expertise to manage its internal resources, among which are its workforce and the skills of its directors but also on its ability to obtain the necessary external resources. Therefore, more diverse boards could increase the company potential to elicit the necessary resources to meet more fully its social and environmental responsibilities.

*Social role theory* considers that men and women are different because of their education. People have a set of beliefs and stereotypes that lead to gender roles. Men and women tend to behave at all times according to those established moral rules and the other's expectations influence their leadership style. Hence, women are more concerned about the welfare of the community, sensitive to social and environmental problems than men. For example, women are reluctant to accept unethical practices, such as pollution. Consequently, female directors are more willing to attend stakeholders' demands and implement CSR measures.

*Legitimacy theory* emphasizes that CSR practices of a company reflect its moral legitimacy and determine its acceptance by stakeholders as a moral corporate citizen. In this sense, gender diversity on corporate boards has a dual implication. On the one hand, the women's characteristics by their educational role involve more empathy to attend stakeholder claims and increase CSR performance. On the other hand, diverse boards are a signal of gender equality; namely, the company offers equal opportunities. All of which legitimizes the company in the eyes of society.

Finally, by accepting that men and women have different features, *upper echelons theory* accounts that the diverse board implies a broader human capital, which involves different decisions. Because women are more susceptible to social and environmental problems, gender diversity on board of directors enhances CSR performance.

## Conclusions

The economic progress of developed countries has highlighted severe environmental problems. Companies must be responsible for the effects of their activities and provide the necessary means to reduce their polluting impact. Likewise, all around the world, there are severe social problems. Extreme poverty affects large areas of the planet. However, the so-called rich countries have social inequalities. In this sense, companies must give back part of their income to society, to achieve a fairer world.

Furthermore, gender equality is also a worldwide concern about which numerous researchers have been working over the last decades, especially in the social and economic fields. Corporate governance reforms and legislation often include a quota of women on corporate boards to increase the percentage of female directors. Indeed, most European countries have enacted laws to force companies to implement an effective gender diversity policy, from 25% in the United Kingdom to 40% in Norway and France. Nevertheless, leader countries as the USA or China have no quota (del Valls Martínez and Cruz Rambaud 2019).

Nowadays, despite the progress made in reducing the gender gap, there still exists a real, though not always legal, undervaluation of women's skills and prejudices about their capability to hold management positions, which represents a reason to enact national and international legislation and corporate governance guidelines to increase the number of women directors. Such policies are not without their critics, which argue that companies should hire directors based on their talents, experience, and education, but not because of their sex. Otherwise, their male counterparts can consider women as tokens and discriminate against them, ignoring their opinions.

From a theoretical and ethical point of view, there are convincing arguments to support gender diversity on company boards. Nevertheless, it is also necessary to argue positive empirical evidence to strengthen this vindication and its derived policies. Gender equality is not the responsibility of the companies since they are

not by themselves instruments of social change. Companies only will increase women directors if they are forced to fulfill a stipulated quota or find a benefit derived from it. Indeed, the aim of profit maximization introduced by M. Friedman in the 1970s is outdated. Today the dominant concept is the stakeholder theory, introduced by Freeman in the 1980s, which considers that not only shareholders have interest in the company, but also a good number of stakeholders, as it was detailed above.

Companies with social and environmental accountability have a competitive advantage over those that do not consider such responsibilities. Investment managers select their portfolios increasingly based on ESG criteria. Empirical analysis has shown that a higher percentage of women on the corporate board enhances the companies' CSR performance. Moreover, companies with a higher proportion of women directors tend to hire also more female workers. Consequently, gender diversity is a signal to markets, which provide legitimacy to the company and improves its reputation.

In conclusion, at least, there are two main reasons to increase the percentage of women on company boards: social justice and business enhancement. First, gender equality is a human right and an aim of the United Nations in all the fields, where is included management positions. Second, empirical research has shown the improvement of social and environmental resulting from a higher female presence on the board of directors.

It is important to remark that the aim is to maximize gender diversity. Namely, a low percentage of women and a low percentage of men is likewise damaging to companies. Until now, women have been discriminated. Nevertheless, the opposite situation would be equally harmful to business, society, and the planet (Valls Martínez et al. 2020).

## Work Ethic

Edmund F. Byrne

Emeritus Professor, Indiana University-Purdue  
University at Indianapolis, Indianapolis, IN, USA

## Synonyms

Work and duty; Work and wealth; Work and well-being

## Definition/Introduction

A work ethic is a value-based motivation for working. In the now developed world, three such values have been stressed over time: social status, duty, and wealth or, simply, money. Craft pride has also been proffered but is increasingly a victim of automation. Each will be considered here. First, however, a few remarks about how socio-economic conditions influence a society's stance regarding one's obligation to work.

Most people throughout recorded history have recognized a connection between work and well-being. A given society will accordingly expect a person to work inasmuch as its fully recognized members need that person's work. Sometimes work needing to be done has been done cooperatively, for example, in a monastery, in a commune, or wherever togetherness thrives. Where the work needing to be done is associated with a subset of those in need of subsistence, a society usually introduces some basis for distinguishing between those obligated to work and those exempted. And where such a partitioning exists some sort of work ethic is likely to be espoused.

## Work Ethic Based on Gaining Social Acceptance

Every society has had many tasks to perform that are necessary but not fulfilling or even pleasurable. One response to this state of affairs is to dream of an altered reality in which there is only

leisure or, at worst, no unfulfilling work. Another is to carve out an exemption from work for those able to maximize the benefits of leisure and compel others to fill the gap as a basis for their social acceptability.

Jewish Talmudic lore, for example, promises a World to Come in which everyone will have ample harvest without effort. More broadly stated in apocalyptic literature: "For men there will be inner sincerity and freedom from care, no unwilling engagement with practical things, and no forced labor" (Charles 1913, 2: 518). One of Virgil's *Eclogues* also envisions a work-free future (Manuel and Manuel 1979, 73–74).

Stories about leisure past are found in many cultures. The Hebrew myth of Adam and Eve's relationship to work in and after Eden is well known, and a comparable myth is on ancient Sumerian tablets (Manuel and Manuel 1979, 36). The Greeks also viewed work as a curse, due indirectly to Prometheus's upstart behavior, and believed that it was once otherwise. Hesiod, in his *Works and Days* (c. 700 B.C.) describes five races, one being a "golden race" of people who lived before the curse of work in a place where food grew bountifully without cultivation. Later tradition recalled this as a golden age in which nature did it all without assistance or, alternatively, some work was required. Philosophers favored the latter.

In his *Republic*, Plato (died c. 348 B.C.) envisioned a society in which the many would provide for the needs and wants of the few. Everyone in this society would be assigned for life to the role for which he or she is best suited "by nature." For most this would be unskilled labor or at best a craft or trade. The ruling guardians, however, would practice no manual art or craft. And philosophers, who focus on eternal ideas, would be the most "useless" of all citizens.

Aristotle (384–322 B.C.) propounded a curse theory of work and agreed with Plato that it is necessary for society as a whole. But he too exempted intellectuals, who can attain wisdom by grasping the ultimate causes of things. For this they need to contemplate, and to contemplate they must be free from concern about the necessities of life. So leisure used effectively leads to

wisdom – not just any wisdom but the wisdom that knows inherently valuable arts like mathematics.

The ancient Athenians took this elitist attitude toward work quite seriously; but they did not disavow every form of work. Working on the land was good; not good was working for someone else for pay or doing work confined indoors, thereby subjecting one's body to deterioration through disuse. Whence their practice of enslaving others to do certain kinds of work. Other societies did likewise, often in imitation of the Greeks. Not the Spartans, to be sure. But the Romans of the Roman Republic in particular copied the Greeks' attitude regarding work. For them the most honorable pursuits were war and politics. As in Greece, freemen worked alongside slaves in many occupations, and by so doing they too lost status.

For centuries thereafter, eligibility for elite status was purportedly based on ability to learn. Those thus endowed – say, for example, the nobility – would rule a society; all others would be slaves or comparably dependent workers, as in a medieval feudal system. Maintaining such a system might well necessitate use of force. But no less helpful in this regard was a new form of work ethic.

## Work Ethic Based on Duty

The elitist Greco-Roman attitudes toward work were gradually undermined over time by the more favorable assessment of work in the Judeo-Christian tradition. At its origins, Christianity was not uniformly supportive of work. Jesus, as portrayed in the Gospels, was focused on his mission. Accordingly, he persuaded hardworking men to abandon their trades and just follow him. Tentmaker Saint Paul, on the other hand, once said only those who work should be fed (2 Thes. 3:10). This ambivalence regarding work persisted down through the Middle Ages. But when sudden depopulation created an urgent need for more working people, new laws prohibited indolence and theologians began associating work with salvation.

Initially Christians embraced the curse theory of work, and as monasteries were founded the monks relied on lay workers for their physical needs. Then Saint Benedict (480–547) founded a monastic order in Italy based on the dual objectives of prayer and work, thereby, some say, removing the curse from work. His original rule divides up the hours of the day in different seasons between manual labor and sacred reading. By the time of the high Middle Ages, though, this espousal of manual labor had been reduced to a mere symbol as the monks left hard work to serfs and wage earners and engaged themselves in more honorific and less tiring crafts such as baking, gardening, and brewing (Le Goff 1980, 84).

Theological giant Thomas Aquinas (1225–1274) separated contemplation and action on the basis of one's position in society. He agreed with Aristotle that contemplation is the highest human endeavor, to which a select few might devote all their attention. He also agreed that only workers deserve to eat – but only if the work is necessary. It was necessary among the common people, so they had a right and a duty to work. They were not to rise beyond their “natural” station in life; but in turn they were entitled to a “just price” for their labor, i.e., a livelihood for self and family. But in cases of necessity, Aquinas notes, everything has to be owned in common, and anyone lacking the basics for survival is entitled enough to remedy this deficiency (1948, II–II, q. 66, a. 7).

A key weakness of this charitable stance is: how determine who is sufficiently deprived to merit care without working? In Aquinas's time there was apparently a surplus pool of labor; so begging was an accepted practice, for example, by the Franciscan friars. But the surplus labor that existed in their day disappeared a mere half century later when the Black Death (bubonic plague) moved from China to Europe and in 5 years (1347–1352) killed from 75 to 200 million people, varying in intensity from 30% to 60% of the population of different countries. More restrictive outbreaks occurred up to 1654 (in Oslo). This decimation of population caused a severe labor shortage, laws to prevent wage increases, and mostly futile peasant revolts in England, France, Belgium, and Italy. To counter such social

turbulence, religious leaders linked eternal salvation to having worked in life; and as economic growth became an ever more important social goal, they developed an ever larger list of salvific occupations. Then came the Protestant Reformers.

Martin Luther (1483–1546) still drew upon the just price theory to tell people to work at the trade or profession into which they were born. But he attributed equal value to any kind of work, active or contemplative, and stressed the religious dignity of one's work as a vocation or calling. Thus in his little book about vagabonds, *Liber Vagatorum*, he linked the Reformation to the growing movement against beggars by endorsing almsgiving only to duly certified indigents.

John Calvin (1509–1564) pushed the religious significance of work farther, making it a necessary means to eternal salvation. Even though committed to a rigorous doctrine of divine predestination, he insisted that the faith by which one is saved is expressed through methodical, disciplined, rational, uniform, and hence specialized work. Casual work is for this purpose inadequate, and dislike of work calls into question one's being among the elect.

The secular side of society bolstered these warnings about damnation by imposing severe civil and criminal penalties on identified shirkers. But such measures proved inadequate; so what was to be done?

For one answer to this question, take the case of England in the sixteenth century. Past reliance on private alms and public punishment had not cured poverty. With people dying in the streets and early forms of enterprise emerging, the need for some level of public intervention became apparent. What resulted, especially during the reign of Elizabeth I (1533–1603), were the Poor Laws, which established almshouses and overseers of the poor as the nucleus of poor relief. In spite of this public generosity, published commentary at the time (e.g., by Richard Morison and Edward VI) stressed hard work as a solution for pressing social problems. Sir Walter Raleigh (like Cardinal Richelieu in France) thought a combination of hunger and religious goading would inspire labor discipline. Puritan sermonizers

collaborated by denying heaven to the uncooperative.

An emphasis on labor as a duty could misfire if tactlessly applied to the indolent rich as well, and some preachers did just that. But others, especially after the restoration of oligarchy in 1660, were more careful to delimit the scope of the duty to those who were capable of nothing better. Late in the seventeenth century, however, John Locke argued that labor as well as inheritance is a basis for property rights (Hill 1967, 127).

## Work Ethic Based on Wealth Attainment

Locke's (1632–1704) view that labor can be a basis of ownership is readily understandable on the surface but has undergone widely diverse interpretations (Vaughn 1980). First off, it tells a New World explorer he can own a piece of land if he works it (labor principle), takes only as much as he can use (no spoilage), and leaves enough and as good for others (sufficiency). How this acquisition theory applies in an established society is debatable. Locke probably is not inviting the bourgeoisie to appropriate inherited wealth. Nor is it likely that he is claiming that the "laboring class" has rights to anything more than subsistence. For, as viewed through a secularized Calvinist lens, the poor deserve little due to their inherent limitations. If they are unemployed, this is because of their moral depravity; if they are employed, they are too busy laboring to tend to anything that requires the exercise of reasoning power. In either case, they are not full citizens but natural resources that must be managed for the good of the nation. Labor, then, is the basis of property – not, however, for the untutored laborer but for an entrepreneur who chooses to work on and improve unclaimed goods. This being the case, poverty is a problem only if the poor are idle, not if the workers are poor (Larkin 1969, 54ff, 72; Macpherson 1972, 194–217; Cranston 1957, 424–427). And to advance this logic, David Hume (1711–1776) recommended imposing a tax on the poor to goad them into working more (Hume 1905, 247). This perpetuation of the

duty-based work ethic was already being undone, though, by views such as Locke's that focused on entrepreneurs.

So argued German sociologist Max Weber (1864–1920) (Weber 1938; Gilbert 1977). Analyzing the heaven-centered explanation of wealth and poverty, Weber concluded that preachers and other agents of attitude formation found motivation for entrepreneurial capitalism in the Puritan version of Calvinism: the theological notion of predestination is tied to the earthly goal of financial success (Tawney 1926).

Actually, Weber posited two work ethics. The narrowest of these is focused on money, i.e., making money is the single-minded goal of the work ethic (Weber 1938, 53). As Weber describes this ethic, it could be interiorized only by the actual or would-be entrepreneur. There is, however, a Calvinist-based corollary to the entrepreneurial work ethic that views poverty not as circumstantial but as a direct result of its victim's failure or refusal to work. This version of the work ethic has been applied even to the unpropertied wage laborer as an incentive to greater productivity, notably via a piecework system. The two versions taken together constitute a reward/punishment account of property and poverty respectively.

Insisting that capitalism dominates the worker as well as the entrepreneur, Weber notes that "traditionalist" (Catholic) attitudes with regard to making money limit progress, but, he believes, there are countermeasures. Motives can be shifted ideologically by recalling that Saint Paul made work a prerequisite to being fed, by emphasizing the link between a fixed calling and one's niche in the hierarchy of labor, and by using "piece rates" (Weber 1938, 55, 57–59). In short, Weber read Calvin's austere theology as providing the ideological underpinning for capitalism. According to Andrew Ure (1778–1857), though, what Calvin provided was a religious justification for the capitalist's hard-nosed approach to discipline on the assembly line.

A Calvinist ideologue of the Industrial Revolution, Ure explained the need for hard work by associating a worker's pain with that of the

crucified Christ (Ure 1835, 423). Calvinism was not, however, the only basis for endorsing work at the time of the Industrial Revolution. Pierre Proudhon (1809–1865), for example, developed an anarchist glorification of labor around the idea that the value of work is directly proportional to how hard it is. Karl Marx (1818–1883), by comparison, was open to the possibility of a work-free utopia, as are some of his modern-day followers. Yet Andre Gorz (1923–2007), a neo-Marxist student of work, once asserted that "after the communist revolution we will work more, not less" (Gorz 1976, 58).

This discrepancy between Marxist and neo-Marxist views of work is due to a fundamental revision of Marx's views by ideologues of the Soviet revolution. Marx himself rejected the duty-based work ethic as a device of capitalist exploitation of the working class. He distinguished between physical and intellectual labor and looked forward to the day when machines would tend to the former and thereby leave people ample time for the latter. According to Herbert Marcuse (1898–1979), this utopian state of affairs, in which the level of unemployment rather than full employment would be the measure of social wealth and freedom, can now be envisioned as an entirely feasible "(c)onsummation of technical progress" (Marcuse 1964, 35–37). But interpreters of Marx in the former Soviet Union took an altogether different tack, reendorsing in a secular frame of reference that very duty-based work ethic that Marx himself had repudiated.

Proclaiming the value of Soviet patriotism and love for the motherland, Soviet moralists endorsed work as the primordial purpose of life. Marx had sought to abolish alienated labor and saw socialism as a means to this end. The Soviet leaders, however, emphasized the need to compete effectively against capitalism, so called on every person to work according to his or her capabilities for the good of the people. Thus motivated they could not experience alienated labor as in a capitalist society. Under socialism Soviet style, one was to identify positively with the work to which one was assigned, whether or not

Marx would say it fulfilled one's potentialities. In every case, one labored for the State, all labor for the State was good by definition, so there was no (ideologically acceptable) basis for complaining about one's work. In other words, a Weberian work ethic without religious overtones was official policy.

Wealth attainment, in short, has become the preeminent goal of work ethics extant in the developed world. In capitalist societies, wealth is being attained by clever entrepreneurs however engaged, and markets await the appearance of others comparably attracted to wealth. In numerous countries today (notably China and some African nations) seekers of wealth do so more collectively in fulfillment of national objectives. In post-communist Russia, the former Soviet work ethic is being transformed by entrepreneurial wealth-seeking, relative openness to free-market competition and the profit motive, and an influx of Western-acquired MBAs (Bohm 2013).

### Work Ethic Based on Craft Pride

The early Industrial Revolution was driven largely by technological innovations that, together with ample supplies of labor, brought about multiple forms of progress at least in the Northern Hemisphere. As innovation expanded, so did the accompanying skills that were effectively employed. Increasingly, however, the emergence of ever more expansive automation has rendered once needed human intervention unnecessary. As a result many types of unskilled as well as skilled labor have become superfluous in developed countries.

This technological displacement of hands-on labor for production severely diminishes the relevance of a work ethic. Employers who face declining workforce needs inevitably resort to massive layoffs and outsourcing, and economists who study these phenomena have come up with no statistically adequate solutions. Politicians promise correctives, but the nature of such remains illusive. More learned assessments are varied, but two kinds are prevalent: the

synchronist view that technology has changed only the conditions of work (for better or worse) and not the value of work, and the diachronist view that technology makes traditional evaluations of work irrelevant and inappropriate.

Synchronist evaluators of work endorse craftsmanship even in a technologically transformed environment. These include goldsmith Benvenuto Cellini (sixteenth century), pre-Revolution philosopher Jean-Jacques Rousseau (eighteenth century), and more recently Jean-Paul Sartre, Jacques Ellul, and E. F. Schumacher (all twentieth century). The diachronous view that technology supersedes human craftsmanship is more widely espoused, especially among technology experts. As one writer puts it, "Accomplishing more work in less time, then leveraging that additional time to solve complex problems, spend time with family, or pursue a side venture is the new calling card of a 21st-century hard worker" (Jenkins 2016).

As numerous types of jobs cease to exist in the developed world, some analysts are beginning to recommend a guaranteed income for every adult; but ordinary people are still too embedded in duty-based thinking to tolerate such a sensible solution to a rapidly emerging problem (Murray 2016). Meanwhile, in developing countries comparatively unskilled labor opportunities are plentiful albeit poorly paid and subject to so-called sweatshop conditions (Wong 2013). An able-bodied person who fails to participate in this highly imperfect economic system might be faulted for not abiding by a distorted but dominant work ethic.

## Work-Family Conflict and Policies

Meraiah Foley

School of Business, University of New South Wales, Canberra, Australia

## Synonyms

Family-friendly policies; Family-to-work conflict; Family-to-work interference; Work-family balance; Work-life balance; Work-life conflict; Work-life policies; Work-to-family conflict; Work-to-family interference

## Definition

Work-family conflict is defined as a form of role conflict, in which the demands of work and family are deemed to be mutually incompatible, so that participation in one domain necessarily leads to conflict in the other (Greenhaus and Beutell 1985; Voydanoff 1988). Work-family conflict occurs at the intersection between one's paid employment and one's private life; this intersection is also known as the work-life interface or the work-life nexus (Greenhaus and Allen 2011). The concept of work-family conflict is bidirectional. Work can interfere with family, resulting in work-to-family conflict, and family can also interfere with work, resulting in family-to-work conflict (Mesmer-Magnus and Viswesvaran 2005; Greenhaus and Allen 2011). When work and family are not in conflict, or are integrated in a more harmonious fashion, work-family balance is said to prevail.

## Sources of Work-Family Conflict

Predictors of work-to-family conflict are primarily located in the work domain and include long or inflexible working hours, interpersonal conflict with managers or coworkers, extensive work-related travel, career transitions, and other forms of job stress (Frone 2003). Conversely, predictors

of family-to-work conflict are primarily located in the family or household domain and may include caring responsibilities, such as child care, elder care, or looking after the sick or disabled; domestic or family violence; and other interpersonal conflicts within the family. Generally, work-to-family conflict has been found to be more prevalent than family-to-work conflict.

### **The Role of Gender in Work-Family Conflict**

There is substantial evidence that both men and women experience significant work-family conflict in equal proportion (Waldfogel 2007). However, the manner in which men and women respond to work-family conflict is strongly gendered. In heterosexual couples where both parties work, women spend significantly more time on unpaid domestic chores and childminding than men, a phenomenon known as the “double burden” or “second shift” (Hochschild 1989). Women are also more likely to work part-time or “opt out” (Stone 2007) of full-time employment in order to reduce the effects of work-family conflict. Men, in contrast, are more likely to work longer hours and assume the traditional breadwinner role. These outcomes are often the result of traditional gender roles and labor market constraints, but have long-term repercussions for women’s economic security and men’s health and well-being.

Work-family conflict is underpinned by cultural and normative assumptions about the relative value and appropriate division of work and family responsibilities, as exemplified by the ideology of the “ideal worker” (Acker 1990). This ideology is the widely held but often unstated preference by organizations for workers who are perpetually available, have no outside responsibilities or encumbrances, rarely get ill or take vacation time, and prioritize work above all else. Framed around the traditional work and life patterns of men, the ideal worker norm gives primacy to paid work over unpaid domestic labor, marginalizing workers with children or other caregiving responsibilities (Williams 2000). Ideal worker

norms have been shown to have a disproportionate impact on working mothers, who are seen as less committed to their work and therefore less deserving of higher wages or promotions than fathers and men and women without children (Budig et al. 2012; Correll et al. 2007). However, fathers who violate the “ideal worker” schema and seek greater flexibility to accommodate traditionally feminine caregiver roles can experience greater stigma than women who do the same (Coltrane et al. 2013).

### **Work-Family Enrichment**

The concept of work-family conflict derives from a scarcity hypothesis, which assumes that individuals have fixed and limited reserves of time and energy, making it inevitable that those who participate in dual roles will experience conflict. Others argue that work and family are not always in conflict, and participating in multiple roles may in fact create a positive spillover (Voydanoff 2001), also known as work-family enrichment (Greenhaus and Powell 2006), whereby the experiences in one role or domain improve or facilitate the quality of experiences in the other. As with work-family conflict, the concept of work-family enrichment is also bidirectional. Work-to-family enrichment occurs when work experiences improve family life, and family-to-work enrichment occurs when family experiences improve one’s life at work.

### **Work-Family Policies**

Work-family conflict has been linked to a range of negative outcomes such as high staff turnover, occupational burnout and stress, poor health, and lower levels of organizational commitment. Reducing the prevalence and severity of work-family conflict has become a significant priority for organizations concerned with building employee loyalty and improving employee diversity and well-being. Furthermore, the rising participation of women and parents in the labor market, the greater sharing of unpaid household labor among men and women, and increased need

for elder care have led to an increased demand among workers for better work-family integration, facilitated by better work-family or family-friendly policies at both the national and organizational levels (Budd and Mumford 2006).

Developing effective work-family policies has become a major concern for many countries. However, availability of work-family policies remains haphazard, with some countries ensuring a generous suite of work-family benefits for all workers and others providing minimal protections or entitlements. Where work-family policies are not guaranteed, access has been found to be uneven. Some studies suggest that employees who are most likely to need work-family policies, such as low-paid, part-time workers, are less likely to have access to them. This has led some to propose that organizations provide access to work-family policies to recruit and retain highly skilled workers, not to address the needs or demographic characteristics of the labor force.

Work-family policies and practices are intended to improve organizational support for employees seeking to balance work, family, and personal life. In general, these supports fall into two categories: structural supports and cultural supports (Kossek et al. 2010). Structural work-family policies alter human resource policies and practices to allow employees greater flexibility over the location, timing, or quantity of work or provide additional resources to enable individuals to integrate their paid employment and unpaid caregiving responsibilities. Examples of structural work-family policies include job redesign to enable greater access to flexible work arrangements; remote working arrangements (such as teleworking, virtual, or home-based work arrangements); reduced workloads or other non-traditional work arrangements; formal policies to enable workers to access leave to accommodate work-family responsibilities, such as parental leave, caregivers' leave, sick leave, unpaid leave, and family and domestic violence leave; allowing workers to purchase additional leave; and providing support for child care or elder care arrangements, such as financial subsidies, vouchers, and on-site child care facilities, or providing access to information about these services.

Cultural supports for work and family are informal workplace social and relational supports that enhance the perception of employees that their organizational cultural norms fully support the integration of work and family roles and that they will not be penalized or marginalized for accessing formal or structural work-family policies. Examples of cultural supports might include providing training for managers and supervisors on how to foster organizational norms that are not based on "ideal worker" assumptions and create more inclusive workplace cultures. Cultural supports operate at the employee-managerial level, where employee access to structural work-family policies is facilitated by the support of individual managers and supervisors, and at the organizational level, where workplace norms and expectations around working conditions are produced and reinforced.

It has been argued that cultural supports are as important as structural supports in promoting work-family balance. Without strong cultural support for work-family policies, workers who access structural work-family policies can often be marginalized or stigmatized. Several researchers have found, for example, that employees who access work-life policies in their organizations are penalized for violating normative assumptions about standard work hours, a phenomenon known as the "flexibility stigma" (Stone and Hernandez 2013; Williams et al. 2013). Employees are more likely to use structural work-family policies if they receive informal support from direct managers or supervisors. Similarly, use of work-family policies is more likely among employees who work with powerful supervisors and colleagues who can shield them from the perceived negative effects on their careers (Blair-Loy and Wharton 2002).

## Work-Life Balance

Bernard McKenna  
University of Queensland Business School,  
Brisbane, Australia

## Synonyms

Life satisfaction; Psychological wellbeing

## Definition of WLB

WLB ensures that the hours and intensity of paid work are sufficiently offset by non-work time that allows workers to physically and mentally regenerate as well to participate in family, recreational, and community activities.

## Ethics and Work-Life Balance

The notion of work-life balance (WLB) is relatively new in the history of paid labor that began with the Industrial Revolution. Its recent emergence can largely be attributed to a confluence of social, economic, and technological events that have dramatically reshaped the nature of work

and social relations, particularly in more advanced economies. The major social impetus, of course, has been the growth of women's participation in the work force; more particularly, the participation of women who have children. Given employees' dual responsibilities in meeting parental and work commitments, increasing numbers of organizations have introduced "work-life balance" policies. These have included maternal and paternal leave at the time of birth and early infancy, flexible working hours, telecommuting and working from home, and child care facilities. Thus, WLB can be defined as "a lack of conflict or interference between work and family roles" (Frone et al. 1992).

While WLB can be understood as a humane attempt by organizations to adapt to employees' life circumstances, its application has raised ethical issues, mostly in terms of distributive justice, but also in terms of how we prioritize various life activities. In the broadest sense, it is important to remember that most people in the world have very little WLB or experience little sense of a duality because of global inequity. Thus, we must understand that the concept of WLB is a phenomenon relevant to advanced and major developing economies. Consequently, the dominant ethical issues for consideration are the implications of juxtaposing work and life, defining work, questioning balance, and challenging the primacy of family as the focus of "life" in this dual categorization.

## Ontological Questions

The ontological foundation of the three words – work, life, and balance – raises some important questions about the cultural assumptions that underpin them. First, the domains of work and life automatically create a dichotomy that may not be experienced by many. For example, people who gain great satisfaction from their work may consider work as crucial and integral to their life. This blurring of the spheres of work and life would be evident, say, when a surgeon muses over the comorbidity symptoms of a patient they treated that day while watching television at night. And, of course, the word "life" stands as a

metaphor. Literally, *life* separates any living matter from inorganic matter by virtue of its capacity to metabolize, transform energy, grow, undergo continual change, respond, and reproduce prior to death. Thus, in a literal sense, work is negatively collocated with death or an inanimate state.

For many, certain types of work have caused the death of the soul, or a purpose for living. This notion which was captured in Gogol's *Dead Souls*, written as serfdom was giving way to modernity in nineteenth-century Russia, focuses on the commonplace vulgarity and spiritual loss caused by the drudgery of work for both the middle-class and the serfs. Karl Marx identified the notion of worker alienation as a concomitant of the impersonal force of market-driven industrial capitalism. The commodification and division of labor alienates worker from the inherent fulfilment that "the species being" experiences in the act of production, Marx claimed. Charlie Chaplin's 1936 film, *Modern Times*, created the visual metaphor of the worker as literally a powerless cog in a huge machine. More recently, the term "get a life" means that a person should stop doing dull, repetitive, routine activities by being more prosocial and active. It is this prosocial feature that appears to underlie the dialectic of work and life. However, the nature of contemporary work in advanced economies has changed considerably from the age of industrialism with service, retail, and administration industries now providing the majority of jobs. Significant also is the growth of part-time work – where women are predominant – relative to full-time work and the increasing use of short-term contracted labor both of which have weakened workers' power to negotiate hours of work that can accommodate parental and other carer responsibilities.

The second question concerns the notion of work being understood as paid work. Yet there is considerable unpaid work that assists those who are employed to work. There is also considerable unpaid caring work that falls to those not in the labor force because it is literally considered as (paid) work. Both of these allow the employment system to operate as it is and for workers' income taxes to remain lower because of lower government expenditure; yet they are largely

unrecognized. Many low-paid employees who cannot afford child care or who live in poorly serviced suburbs frequently need to draw on family, friend, and community networks to mind their children while they work: Paradoxically, for some, this paid-work is to mind the children of well-off professionals. In terms of unpaid work caring for elderly and disabled people as well as children, this is predominantly done by women (see, e.g., Australian Human Rights Commission (2013) *Investing in care: Recognising and Valuing Those Who Care Research Report*). A significant consequence of this is that such women-carers often have inadequate retirement money for their ageing years.

More broadly, nonwork time can include time for people to use in a communal sense. This could involve membership in philanthropic organizations, but could also include participation in organized recreational pastimes such as sport, music and dance, self-improvement groups, and local conservation projects. Consideration of this sort of nonwork “life” activity is virtually absent in work-life balance considerations, although some firms have institutionalized benevolent corporate activities. Individuals’ participation in organized social philanthropy and enjoyable pastimes activities significantly contribute to social cohesion and social capital. Robert Putnam’s *Bowling Alone* identified and lamented Putnam’s (2000) the loss of social capital that produces civic society because of the changing nature of work and social institutions. Putnam points out that de Tocqueville in the 1830s identified the Americans’ proclivity for civic association as a vital element of American democracy, and this is still likely to be universally true. Community associations such as Rotary have experienced a substantial loss of membership largely because of increased work demands on potential members further contributing to an age-divide in social involvement. With increased life expectancy, adult working children are increasingly taking up unpaid caring roles for aging parents, creating considerable stress for those seeking to maintain their work commitments. Yet such considerations are rarely acknowledged as an acceptable reason

for more flexible, even reduced, work activity. Thus nonpaid work and community participation, which are vital to the functioning of civil society, may be a further reason to reconsider the work-life binary as it is currently understood.

Thirdly, one might ask what the word *balance* means in this equation. Should the paid work and nonwork domains be equivalent in hours? Is all time equal? An odd question perhaps, but not when we consider the notion of *quality time*, which is a term that has emerged largely in relation to time-poor parents who acknowledge that they spend insufficient time with their children, or less so, their partner. This deficiency in the quantity of time, it is argued, can be offset by the “quality time,” which is characterized by attentiveness, acknowledgment, intensity, and involvement in a variety of activities. Clearly, then, this notion of balance means that units of time are not equal, depending on the criteria to be applied: a solicitor’s billable hours or baking a cake with a child.

Finally, one might ask whether there is an implicit moral judgment in the notion of WLB. This is because invariably WLB is built around the notion of family responsibility (Casper et al. 2007). Rarely is it asked whether the number of expected hours of work might be challenged. In the case of professionals, there is a pay-off in terms of increased payment whereas for many on wages increased time worked is often unpaid. That is, for many there is a creeping expectation to work beyond the mandated hours without overtime pay, or in the case of zero-hour contracts (which operate in the USA and the UK) to work at irregular and inconsistent times. The current discourse does not seem to recognize those who simply want to work a 35–40 hour week (the “normal” work week for most of the twentieth century in the Western world) because it allows them to do things they enjoy whether it be going to the gym or growing roses. Those who choose this lifestyle – previously considered “normal” – now quite often get represented as not being a team player, lacking motivation, or not sufficiently contributing to the organization. Clearly, there is a moral censure of such people’s

dissoluteness or even mild decadence. Recreational time should be understood as a time to re-create physical and mental harmony and balance in one's life, and only makes sense in terms of a binary with the concept of work: otherwise such time would merely be idleness.

While the issue of WLB is a concern for all members of the workforce, it is clearly more salient for women (Charlesworth and Macdonald 2014), because of the cultural lag of socially determined gendered roles from a time prior to women's increased involvement in the labor force and obviously because of women's biological childbearing role. As a consequence, it is clear that women's career opportunities are adversely affected and that they also face the psychological distress of "deontic obligation to both workplace and family" (McKenna et al. 2016: p. 1100). Until these sociological and psychological issues are addressed societally, outcomes are likely to be piecemeal and unequally distributed. Addressing the issue properly requires the intervention of government in two ways. First, governments need to legislate for a bottom-line of minimum work standards to be complied with at the organizational level so that workers have the time and the flexibility to balance their work life with non-work activities that may or not be related to caring. Second, governments need to provide proper care not just for children but also elderly and disabled people that can be supplemented by family and friends who can enrich others' lives. A society that valorizes excessive work, efficiency, cost reduction, and profit making at the expense of human satisfaction, social cohesion, and humanity clearly cannot provide proper balance between work and life.

## Workplace Bullying

Clive R. Boddy

Tasmanian School of Business and Economics,  
University of Tasmania, Hobart, TAS, Australia

## Synonyms

Abusive supervision; Harassment in the Workplace; Mobbing; Workplace incivility

## Definition

Bullying at work entails the persistent unfair treatment of staff by one or more employees, often of greater seniority than the victims. Bullying can be covert, subtle, and emotional in nature or more overt and physical and can include rudeness, yelling, sarcasm, overworking, name calling, sexual harassment, creating scapegoats, threats, and even violence. In terms of origins, there is debate over whether culture or leadership makes up the primary causes of bullying, and these two are interrelated. Bullying stems particularly from leaders with dark personalities – the self-

interested, politically skilled psychopaths, Machiavellians, and narcissists who may be found in the workplace. The bullying can be instrumental in that it is used as a camouflage for other, more nefarious activities, which workplace colleagues are hesitant to investigate for fear of being bullied. The bullying may also be malicious – undertaken just for the pleasure of it, because for example psychopathic bullies enjoy hurting people.

Such workplace bullying is difficult to deal with because of the hierarchical nature of the bullying which can be passed off as close management – apparently aiming to maximize productivity rather than stimulate the appetite for cruelty and desire for chaos of the bully. HR personnel tend to side with the organizational managers who may be the source of the bullying, thus providing little relief for the bullied who feel victimized and helpless.

## Description

In terms of the causes of bullying, some leading researchers differentiate between dispute-related and predatory bullying (Einarsen 1999), and psychopathic bullying comes under the latter definition. Recent research has established a strong relationship between dark triad traits – narcissism, Machiavellianism, and psychopathy – and bullying and has demonstrated that psychopathy is most strongly related to bullying, followed by Machiavellianism, and narcissism (Baughman et al. 2012; Boddy 2014). As would be expected, transformational and ethical leadership is less associated with institutional bullying than dark leadership or laissez-faire leadership.

Some writers state that bullying can stem from institution-related cultures while acknowledging that individual leaders may contribute to and shape those cultures (e.g., Baillien et al. 2009). As one example of this, a culture of aggressive internal competition for job continuance was generated at Enron (see entry on ► “Enron Scandal”), and this produced a ruthless, cut-throat, and abusive workplace environment. However, while this cultural argument is true as far as it goes, it was the dark personalities at the top level of leadership of

Enron who created, fostered, and encouraged this abusive culture in the first place. Disorganized, chaotic, and badly managed workplaces are associated with bullying but also with corporate psychopaths and so the cause and effect relationship between environment and leadership is difficult to disentangle. However, prominent leadership researchers like Hogan and Kaiser conclude that leaders determine culture and culture underpins outcomes. Certainly “dark triad” leaders, unethical workplace environments, and bullying appear to coexist. On the other hand, health services providers like the UK’s National Health Service often appear in the bullying literature (Hutchinson et al. 2013), and it may be that their multileveled hierarchical nature facilitates the expression of behavior that can easily be perceived and felt as bullying. In the UK, health service medical professionals have claimed that health service workers should be taught how to recognize and deal with psychopathic managers in order to learn how to cope with the pervasive bullying that will be encountered.

Workplace bullying is widespread, some say at epidemic proportions, and while small minorities of employees report that they experience it at any one time, very large minorities of employees commonly report that they have ever experienced bullying. Bullying has an effect on victims which can range from mild to very severe with examples of posttraumatic stress disorder and complete emotional breakdowns being evident in extreme cases. Victims feel abused, vulnerable, heart-broken, belittled, unsupported, psychological despair, emotional pain, dissatisfied with their jobs, hurt, anxious, depressed, exhausted, and unjustly treated.

Consequences at the individual level include reduced cognitive functioning, a feeling of being tortured and of job insecurity and intimidation, demoralization, career derailment via disengagement, absenteeism, “presenteeism,” withdrawal and unemployment, reduced well-being, and emotional distress. Organizations suffer as communications, cooperation, and friendliness decline in an abusive environment; furthermore, talented personnel are compromised in their performance, seek retribution via counterproductive

work behavior, are lowered in their commitment, withdraw, and eventually leave the establishment, all resulting in lowered productivity and higher costs. This also represents a loss to the world economy as a whole in terms of absenteeism, lost opportunity, costs, and lost expertise via disengagement and unemployment, resulting in lowered productivity and global GDP.

Many governments distinguish between bullying and harassment which is based on discrimination by sex, sexual orientation, race, ethnicity, ability, and being a member of a historically discriminated or marginalized group. Often there is specific legislation to address this type of harassment whereas bullying on its own is not specifically illegal unless it constitutes an actual assault. For example, many countries have laws covering sexual harassment or harassment based on personal differences, and in these countries victims have the opportunity for legal redress.

## Workplace Values and Ethical Performance

Carole L. Jurkiewicz

School of Public Affairs, University of Colorado

## Synonyms

Codes of ethics; Ethics; Leadership; Morals; Organizational evil; Value systems; Workplace spirituality

## Introduction

Workplace values, or the set of moral-laden statements that characterize an organization, both explicitly and implicitly, are established by the leader and emulated to varying degrees by employees. The most essential aspect of workplace values is that employees will adopt those that are evinced through the leaders' behaviors rather than what may appear in ethical codes or organizational documents. This is true across all sectors. The greater the congruence between the positive ethical standards presented in organizational materials and what is actually observed in leader behaviors, policies, and processes, the greater the ethical performance of the organization.

## The Values-Performance Connection

Workplace values most often evolve from the culture of the organization and are most often unintended. Few organizations consider an ethical value set as a strategic tool and assume ethical considerations will take care of themselves. Intentional development of workplace values can create high levels of motivation, loyalty, increased financial stability, and decreased human resource costs. Unfortunately, organizations almost always engage in this process only in reaction to scandal, litigation, whistle-blowing activity, or other

public problems resultant of unethical practices, policies, or leader behaviors (Jurkiewicz 2012). Unintended value sets tend to be incongruous, leave employees feeling frustrated and lacking in organizational citizenship, and lead to high rates of turnover and negative health outcomes, as well as emboldening unethical behavior.

As leaders model behavior and employees are rewarded or disciplined for their conduct, and as policies and processes are instituted and enforced or ignored, an understanding of what is viewed as good or bad results; this is what creates a collective set of workplace values. Separate from any code of ethics or formal reports, this set of values guides organizational behavior and performance and determines the level of ethicality of its employees (Jurkiewicz 2002). It is not possible for a leader to truthfully disavow himself/herself from unethical behaviors occurring in the organization, as they have facilitated and rewarded such conduct. Conversely, one won't find an ethical organization with an unethical leader at the top. The method by which workplace values are communicated is incremental, and an organization can shift from ethicality to evil in such small steps over time that it can appear startling in hindsight (Jurkiewicz and Grossman 2012). Logically, if a leader asserted an unethical or evil value set for the organization from the start, there would be backlash. This is why one often finds ethical duplicity whereby written documents state one thing, but leader behaviors convey a very different message. Most individuals seek to align their sense of right and wrong with that of the people to whom they are closest, such as colleagues, a boss, or family and friends. This near universal tendency reinforces and exacerbates the ethicality of the leader, whether in a positive or negative direction.

Workplaces values can advocate for higher-level ethical performance, such as those emphasizing respect, transparency, generativity, and benevolence, or lower-level standards that support environmental harms, taking advantage of clients, demographic bias, or knowingly delivering faulty products or services (Jurkiewicz and Giacalone 2004). Workplace values are equally as responsible for the progressive and ethically

accountable reputations of, say, the company Patagonia or the current government of New Zealand, as they are for the Hitler regime and Enron debacle. Individuals have a strong aversion to being seen as unethical and will go to extremes to craft a public image of ethicality; Lance Armstrong, who strenuously denied cheating in the Tour de France competition for years before he was forced to confess, is an iconic example of this commonplace strategy.

Unethical workplace behavior has become more widespread and increasingly more damaging to society and individuals (Jurkiewicz 2012). This decline has been associated with, in addition to those outcomes noted above, deteriorations in mental and physical health, feelings of dehumanization, and increased violence, among many other artifacts. Workplace value sets that contribute to this dysfunctional performance include exaggerated competitive and time pressures; unequal resource distribution; socially disparate treatment of employees and clients; and a leader who refuses accountability for his/her errors (Jurkiewicz and Giacalone 2016). Research has demonstrated that ethical workplace values have a strong, positive effect on organizational and individual performance. Additionally, it can strengthen the organization's financial position and reputation, stationing it to hire the best people and to keep them.

It is much easier to implement ethical workplace values from the start rather than attempting to build trust after it has been broken, but it is possible. The use of ethics audits; dynamic and ongoing ethics education; an inclusive and non-hierarchical approach to developing a code of ethics concomitant with effective communication and enforcement programs; and effective accountability and oversight methods in hiring and assessing organizational leaders are all effective methods for enhancing ethical performance through workplace values (Jurkiewicz 2012).

## Conclusion

The workplace culture a leader creates and the values that define that culture exert a potent

influence on ethical performance, both because of modeling behavior and reward systems and because employees adopt their ethical systems from those around them in the organization. With workplace ethicality and trust in organizations on the decline, and the outcomes serious and long-lasting, the outlook can appear bleak. Yet research offers insight into a number of techniques and practices that can serve as both preventative and restorative measures. The greater the awareness of how workplace values can affect ethical performance, as well as the health of the organization, the greater the likelihood that this downward trend can be reversed.
